AMD Buys $2.1B Wafers

News

ADVANCED MICRO DEVICES (AMD) (*154.36 +8.22*) *I*

Advanced Micro Devices to Buy $2.1 Billion of GlobalFoundries Wafers Under Expanded Deal

10:19 AM EST, 12/27/2021 (MT Newswires) -- GlobalFoundries (GFS) said Dec. 23 that semiconductor company Advanced Micro Devices (AMD) will now buy nearly $2.1 billion worth of its wafers starting 2022 through 2025 under an expanded deal. A wafer is ... (MT Newswires 10:19 AM ET 12/27/2021)

Bob Says AMD is Good to Go

Quora

Bob McConnell, former VP, Embedded Processors at Advanced Micro Devices (1984-1999)

Answered Dec 3

I didn't read all the comments, but decided to answer the question. I participated in some of the Intel-AMD lawsuits. The end result of these lawsuits is that Intel is not going to be able to keep AMD from continuing to make and sell x86 processors. AMD no longer needs any information from Intel to design x86 instruction set processors. They have learned how to do it themselves. If Intel has any patents on the x86 architecture, AMD is licensed to those patents. AMD actually has a license to Intel's microcode! It's no longer relevant, but it was a big part of the lawsuit. In case you are wondering Intel tried lying,cheating, and stealing and generally behaved like scumbags.

Beyond all that, Intel is far better off with AMD getting 20% market share and providing another source. The push to ARM would be much stronger now if AMD was not in the game

Advanced Micro Devices, Inc.

Old AMD Headquarters
(Sunnyvale, California)

Founder	Jerry Sanders +7
Headquarters	Santa Clara, California, U.S.
Area served	Worldwide
Key people	Lisa Su (President and CEO) John Edward Caldwell (Chairman)
Number of employees	10,100[3] (2018)

Advanced Micro Devices, Inc. (**AMD**) is an American multinational semiconductor company based in Santa Clara, California that develops computer processors and related technologies for business and consumer markets. While initially it manufactured its own processors, the company later outsourced its manufacturing, a practice known as fabless, after GlobalFoundries was spun off in 2009. AMD's main products include microprocessors, motherboard chipsets, embedded processors and graphics processors for servers, workstations, personal computers and embedded system applications.

AMD is the second-largest supplier and only significant rival to Intel in the market for x86-based microprocessors. Since acquiring ATI in 2006, AMD and its competitor Nvidia have maintained a duopoly in the discrete graphics processing unit (GPU) market.[4]

AMD Accelerated Processing Unit

Release date 2011

Architecture	AMD64
Cores	2 to 4
Transistors	32 nm 1.178b (Llano) 32 nm 1.303b (Trinity) 32 nm 1.3b (Richland) 28 nm 2.41b (Kaveri) 14 nm 4.95b (Raven Ridge)

The **AMD Accelerated Processing Unit** (**APU**), formerly known as *Fusion*, is the marketing term for a series of 64-bit microprocessors from Advanced Micro Devices (AMD), designed to act as a central processing unit (CPU) and graphics processing unit (GPU) on a single die.

AMD announced the first generation APUs, *Llano* for high-performance and *Brazos* for low-power devices in January 2011. The second generation *Trinity* for high-performance and *Brazos-2* for low-power devices were announced in June 2012. The third generation *Kaveri* for high performance devices was launched in January 2014, while *Kabini* and *Temash* for low-power devices were announced in the summer of 2013.

The Sony PlayStation 4 and Microsoft Xbox One eighth generation video game consoles both use semi-custom third generation low-power APUs.

Intel CPUs with integrated HD Graphics also have a CPU and GPU on a single die, but they do not offer HSA features (see below).

AMD Process Roadmap

At Computex, Su showed off an existing AMD desktop processor chip that had added memory stacked on top of it using the new technique. By putting the processor and the memory in closer contact, the performance of the most-demanding video games improved 15%.

"The next frontier is really to go into the third dimension, the idea of stacking chips on top of each other," Su said. The stacked chips must be carefully designed so that they don't overheat or use too much power. Comparing the process to snapping Lego bricks together but on a microscopic scale, she added: "It looks nice, but it's actually very hard to do.'

AMD will only be using the stacking technique on high-end chips, aimed at video gamers and businesses that are willing to pay extra. "This is not something that will show up for the mainstream consumer products," Su said. "It will be the top-end performance that you can get from some of our processors."

AMD x86-64 ISA

X86-64 a 64-bit version of the x86 instruction set, first released in 1999. It introduced two new modes of operation, 64-bit mode and compatibility mode, along with a new 4-level paging mode.

Threadripper

Maheshwar S Kadi, Technology, Rider at R-15 Bikers of Bangalore (2016-present)

Answered July 7

The fastest CPU in market as of now is AMD Ryzen Threadripper 3990X. below are the specs of the beast. Also, not to forget the price as of today is costing bomb of ₹ 4 Lakhs ($ 5199).

CPU Cores: 64
Threads: 128
Max Boost Clock: Up to 4.3GHz
Base Clock: 2.9GHz
Default TDP / TDP: 280W
L1 Cache: 4MB
L2 Cache: 32MB
L3 Cache: 256MB
CMOS: TSMC 7nm FinFET
PCI Express Version: PCIe 4.0

AMD vs. Intel

Which chipmaker is growing faster?

Based on these facts, it's easy to see why AMD grew at a faster clip than Intel over the past three years.

Revenue Growth (YOY)	2018	2019	2020
Intel (NASDAQ:INTC)	13%	2%	8%
AMD (NASDAQ:AMD)	23%	4%	45%

DATA SOURCE: ANNUAL REPORTS. YOY = YEAR OVER YEAR.

AMD's growth decelerated in 2019, mainly due to slower sales of gaming consoles. However, its growth accelerated again in 2020 as it launched its new Ryzen CPUs and Radeon GPUs, while Intel's ongoing chip shortage continued to generate tailwinds for both its PC and data center businesses.

Intel's overall revenue growth initially seems stable, but its data center chip sales declined year over year in the second half of 2020 -- which partly offset its higher sales of PC CPUs during the pandemic.

Intel recently outsourced the production of some of its chips to TSMC to resolve its ongoing shortages, but it doesn't expect to launch its next-gen 7nm chips until 2023. AMD launched its first 7nm CPUs back in 2019, and it will likely launch its first 5nm chips in 2022.

AMD vs. Intel CPU's

The Motley Fool

Latest Stock Picks | Investing Basics | Stock Market | Retirement | Personal Financ

The key differences between Intel and AMD

Intel generated 56% of its revenue from PC-centric chips last year. It generated 36% of its revenue from data center chips, while the remaining 8% came from other types of chips -- including IoT (Internet of Things) chips, programmable chips, computer vision chips, and memory chips.

Intel agreed to sell most of its memory chip business to **SK Hynix** last October, and it's developing discrete GPUs to complement its CPUs and compete against NVIDIA and AMD. However, Intel's core business still mainly relies on its sales of x86 CPUs for PCs and data centers.

Intel manufactures its own chips with its internal foundry. But Intel's foundry fell behind **Taiwan Semiconductor Manufacturing** (NYSE:TSM), the world's largest third-party foundry, in the "process race" to create smaller chips in recent years. Those mistakes clogged up Intel's foundries and caused shortages of its latest CPUs.

AMD, which outsources the production of its CPUs and GPUs to TSMC instead of manufacturing them internally, didn't struggle with any shortages. As a result, AMD's share of the global x86 CPU market more than doubled from 18.1% to 39.4% between the first quarters of 2017 and 2021, according to PassMark Software, as Intel's market share plunged from 81.9% to 60.5%.

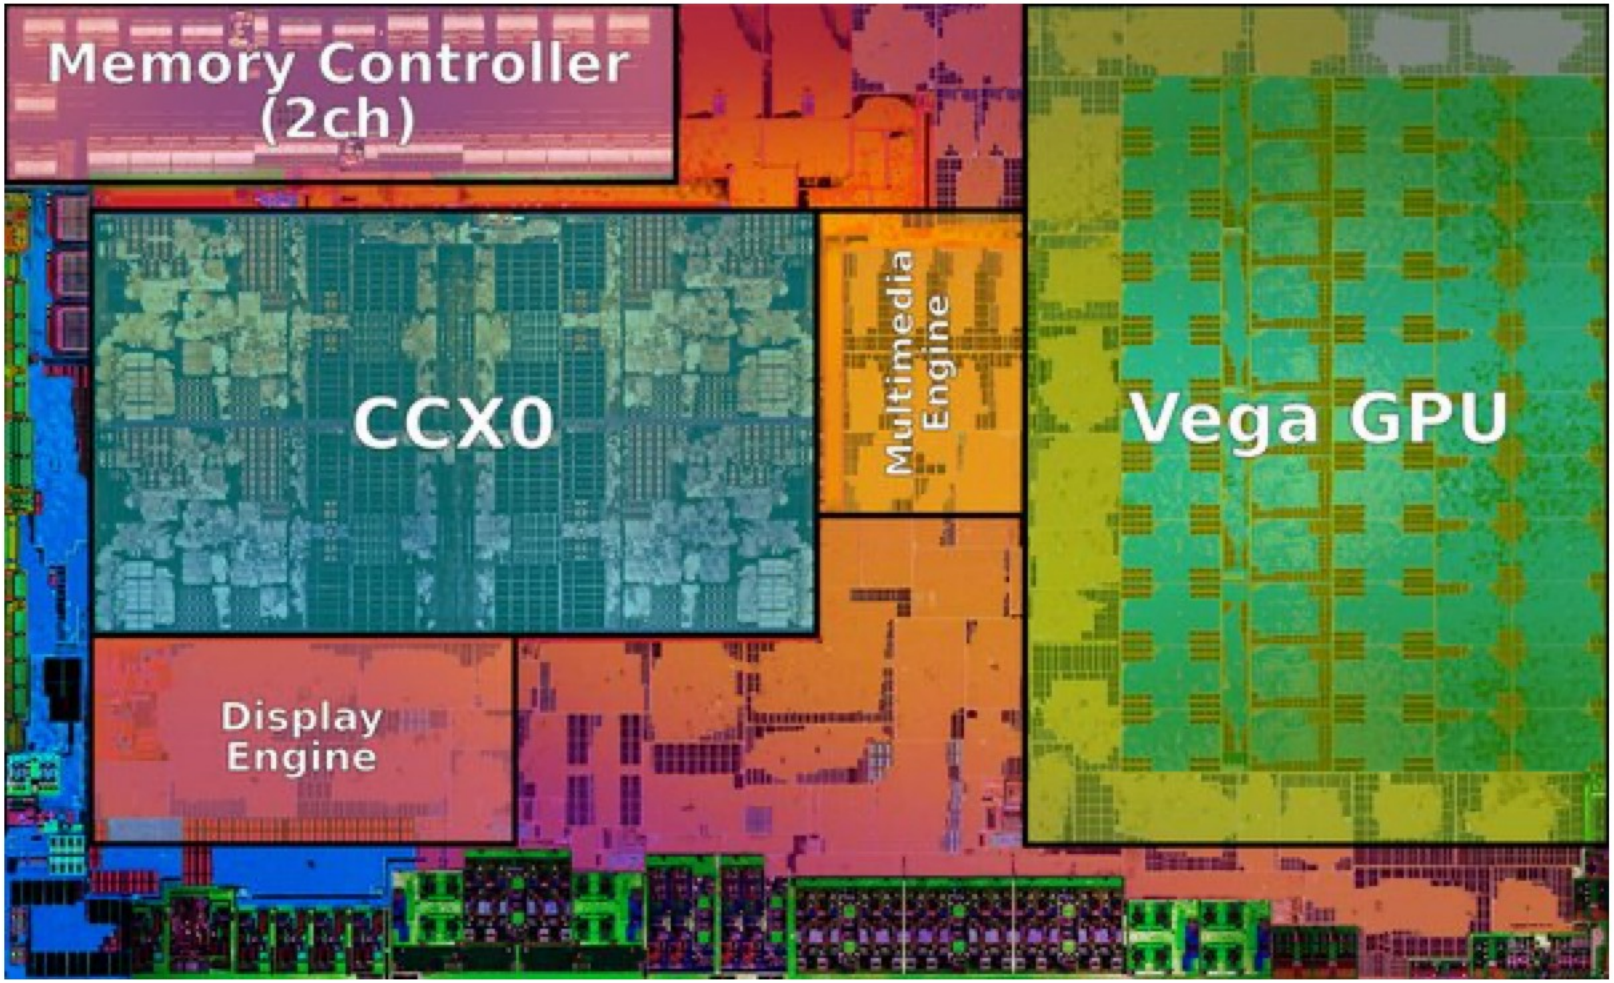
Last year, AMD generated nearly two-thirds of its revenue from its computing and graphics segment, which sells its Ryzen CPUs and Radeon GPUs. The rest of its revenue came from its EESC (enterprise, embedded, and semi-custom) business, which mainly sells custom chips for gaming consoles (including **Sony**'s PS5 and **Microsoft**'s Xbox Series consoles) and Epyc CPUs for data centers.

AMD Epyc

CPU NAME	CORES/THREADS	BASE CLOCK	BOOST CLOCK	L3 CACHE (V-CACHE + L3 CACHE)	L2 CACHE	TDP
AMD EPYC 7773X	64/128	2.2 GHz	3.5 GHz	512 + 256 MB	32 MB	280W
AMD EPYC 7573X	32/64	2.8 GHz	3.6 GHz	512 + 256 MB	32 MB	280W
AMD EPYC 7473X	24/48	2.8 GHz	3.7 GHz	512 + 256 MB	12 MB	240W
AMD EPYC 7373X	16/32	3.05 GHz	3.8 GHz	512 + 256 MB	8 MB	240W

Meanwhile, **AMD is planning to launch its Milan-X processors with 3D V-Cache technology by the end of the year.** The specifications surfaced a while back. According to the source (@ExecuFix), Milan-X will consist of four SKUs ranging from 16 core all the way to 64 core. Interestingly, **all of them will feature 768MB of L3 cache** which is just insane, and rather excessive for the lower-end SKUs. It's possible that the final retail parts will disable part of the L3

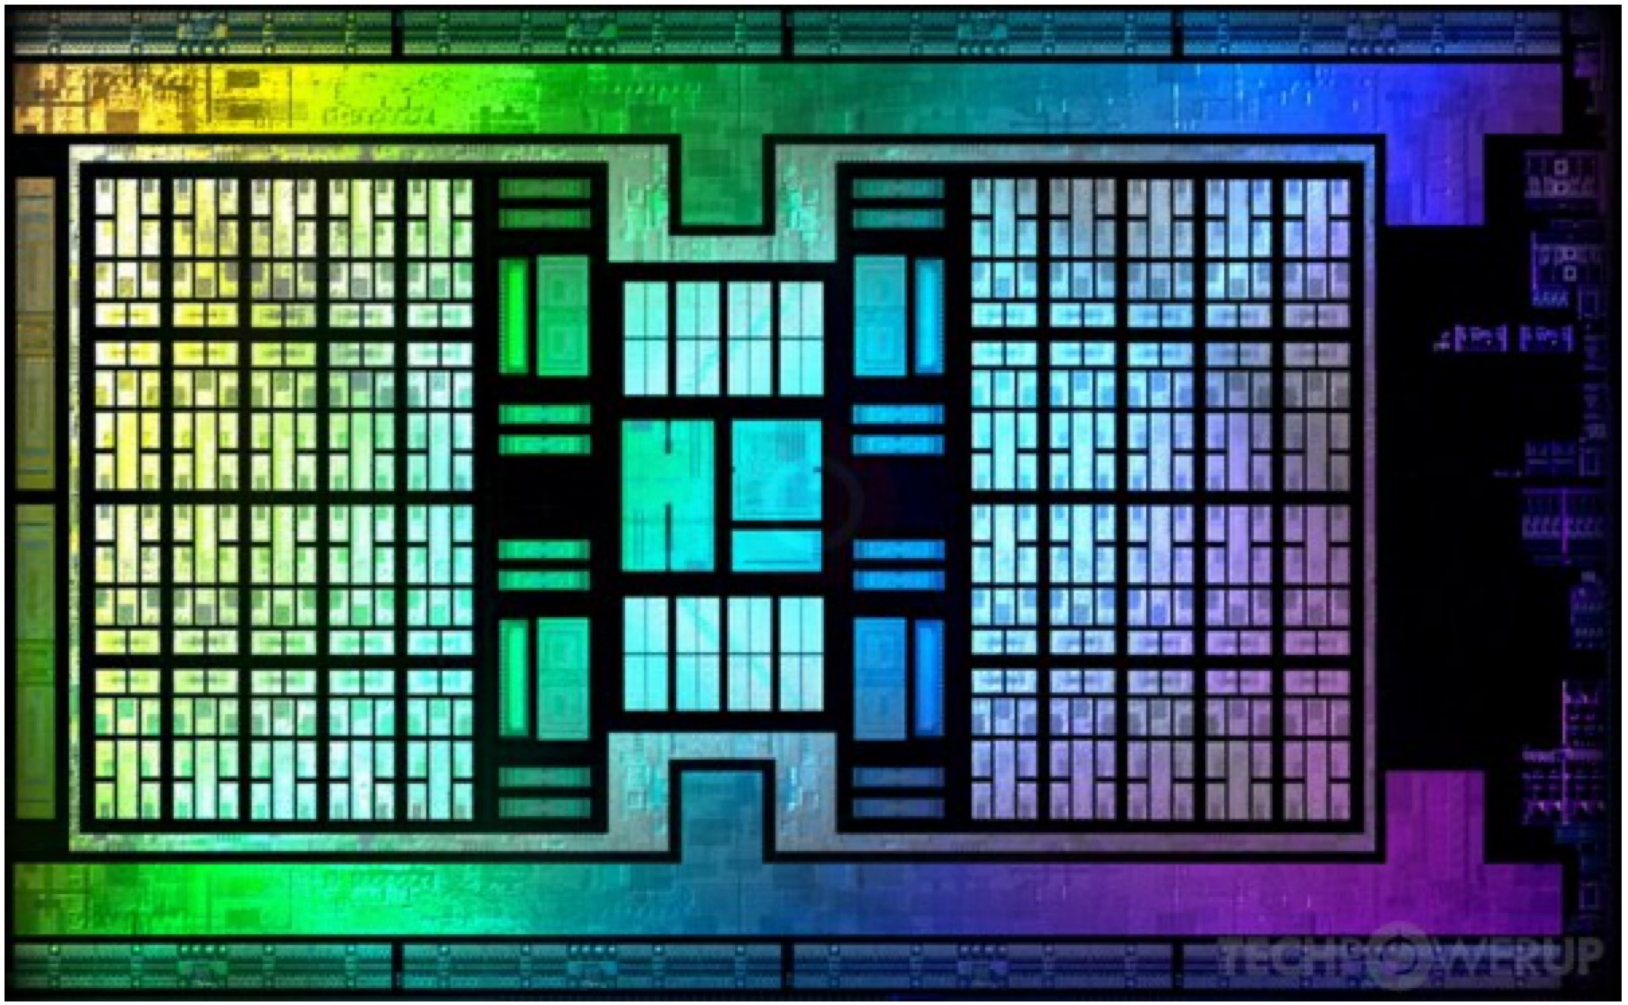
AMD APU's



Above is a annotated diagram of a Raven Ridge APU die, the Vega GPU and it's engines takes up well over half of the die, CCX is where AMD crams their cpu cores and caches on these hybrid chips.

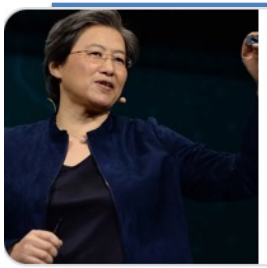
AMD Navi GPU Die

26.8B Transistors 7nm TSMC



Here's AMD's NAVI 21 GPU, which is even larger at 520 mm², but since it's based on a 7nm process, it contains a mere 26.8 billion transistors.

AMD in Teslas



AMD wins first contract to supply chips to Tesla

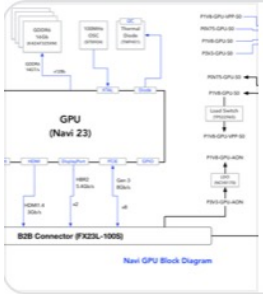
AMD processors and graphics chips will go in the infotainment...

https://fortune.com/2021/05/31/amd-tesla-contract-chips-infotainment-...

The above article says on it this:

> **The Tesla contract adds to AMD's momentum** following three years of gains in the computing market. **As a supplier to one of the buzziest U.S. companies**, AMD can claim significant bragging rights and yet another victory over its rivals.

The article has a lot more information on it for people who want to make a fortune! Here is another article about the same thing but with a different perspective!



AMD confirms Tesla's new Model S and Model X will boast RDN A 2 GPUs

It appears that Elon Musk was not exaggerating when he stated in...

https://www.teslarati.com/tesla-model-s-model-x-mcu3-specs-amd-gp...

> **With its RDNA 2 graphics system and Triple A gaming capability confirmed, Tesla's new Model S and Model X are on track to become the vehicles with the most advanced infotainment systems on the road.**

AMD in Teslas

AMD processors and graphics chips will be used in the infotainment systems of newly updated Tesla Model S and Model X electric cars, which are expected to go on sale in a few weeks. With AMD's more powerful chips, Tesla owners will be able to play cutting-edge video games in their cars—when they're not driving, of course–and see maps and other items in more detail.

"The work (Tesla) is doing is truly pushing the leading edge of what you can put into a car," Su told *Fortune* in an exclusive interview before announcing the Tesla deal on Monday at the Computex computer show in Taiwan. She described the effort to make in-car dash systems as powerful as high-end PCs "part of the broader trend that computing is everywhere."

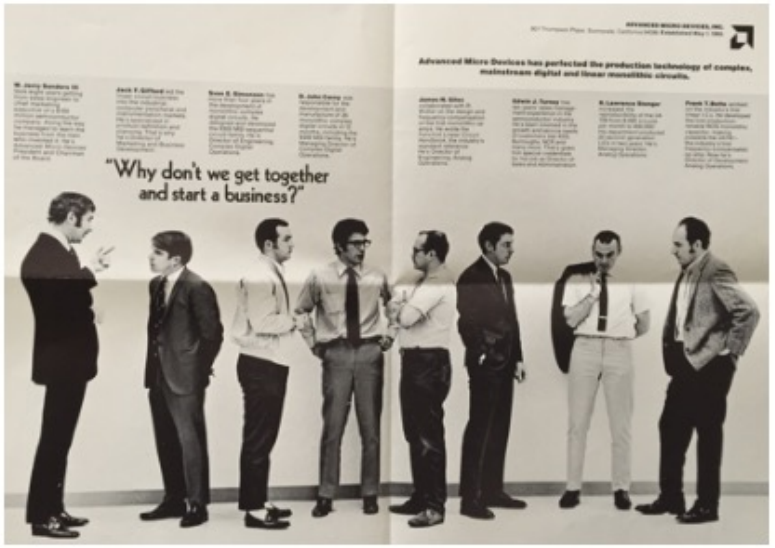
TECH HISTORY ARTICLE BY DR JEFF DROBMAN



❖ **AMD Founders**

The 8 AMD founders, all Fairchild engineers, are listed here:

1. **Jerry Sanders** – *Chairman, President and CEO* (remained in those positions until the twilight; retired in 2002 at age 65)
2. **D. John Carey** – *Dir Digital Operations* (left to be CEO of Integrated Device Technology ca. 1980)
3. **Edwin J. Turney** - *Dir Sales and Admin* (left in 1974, to be replaced by "Z") [b. 1929-- d. 2008]
4. **Sven-Erik Simonsen** – *Dir Engineering, Digital Operations* (remained for many years) *[Ed. note: my direct boss]*
5. **John "Jack" Gifford** *Dir Mktg and Bus Dev* (left to be CEO of Maxim Integrated Products; BS UCLA 1963, MS UC Berkeley [b. 1941--d. 2009]
6. **Jim Giles** *Dir Engineering-Analog Operations*
7. **Frank T. Botte** *Dir Dev-Analog Operations*
8. **Larry Stenger** Managing *Dir-Analog Operations*

WJ "Jerry" Sanders III (b. 9-12-1936) – *Chairman, President and CEO*

As stated in the ad, Jerry spent his first 8 years in semiconductor IC sales and marketing, after graduating magna cum laude from the University of Illinois in electrical engineering. Jerry's first job was a brief stint as a design engineer for Douglas Aircraft in Los Angeles. Jerry early on got the "sales" itch, and went to work as a Sales Engineer for Fairchild (ca. 1960) in the Los Angeles area. Jerry got promoted to District Sales Manager and opened an office in Hollywood. There, he worked with Ed Turney, his first Sales Engineer. After the Hogan

First 15 Years

ABOUT THE AUTHOR

Tom Skornia served as legal counsel at the initial organization of AMD in 1969. He continued in that capacity until joining the company full time as Vice President and General Counsel from 1977 through 1982. In these roles, he was involved in or privy to every major event at AMD for thirteen of its first fifteen years. For the next two years, he followed its developments closely from outside while he prepared the original of the manuscript for this book.

Skornia is an alumnus of Grinnell College, as was the late Bob Noyce,

The State of Fairchild

The Mot invasion: **Hogan's Heroes**

HOGAN'S HEROES

In the summer of 1968, Sherman Fairchild took stock of his namesake company and found it wanting. After a decade, and without impressive competition in its chosen field, the company still had a poor reputation for on time delivery and product reliability. Its strong suits were marketing and sales and technological innovation. Jerry Sanders' hard-charging sales guys had contributed greatly to a massive broadening of the applications for transistors. Fairchild scientists had created the seminal planar process. Founder Bob Noyce had invented the integrated circuit itself. The honor of this latter breakthrough, however, ultimately had to be shared with Texas Instruments' Jack Kilby to settle a lawsuit brought by TI over the question of credit for that invention.

AMD & IC History 1969-84

1968

First 15 Years

The Mot invasion: **Hogan's Heroes**

Dr C. Lester Hogan → Wilf Corrigan

Fairchild opted for a group he identified as more manufacturing managers than engineers to address the delivery and reliability problems. Still, the seven top managers he brought in from Motorola were themselves engineers. And their leader, C. Lester Hogan, was a fairly prominent semiconductor technologist in his own right. Interestingly, two of these "Hogan's Heroes" later became high level managers at AMD. They joined in 1974, roughly concomitant with a palace coup by another Hero, Wilfred J. Corrigan, who succeeded in displacing Hogan himself as President and C.E.O. of Fairchild.

The "Hogan's Heroes" label was actually adopted by a group of Fairchild sales guys for themselves upon their hearing of the intended Hogan takeover while they were attending the Fairchild annual sales conference in Hawaii in

Exit Intel Founders 3: Aug 1968

Noyce, Moore, Grove

THE INTEL TROIKA:

Sherman Fairchild's mid-game management substitution set off an expectable reaction. Bob Noyce, Gordon Moore and Andy Grove (the top two technologists and the top manufacturing guy) left Fairchild to form Intel Corporation in August 1968. They were joined over succeeding months by many other Fairchild supporting stars. This was neither the first nor the last important Fairchild semiconductor spinoff. But it was a watershed in that process in eviscerating Fairchild's technology staff and forever dooming its efforts to enter the MOS business as an effective competitor. (An earlier spin off to National Semiconductor of Charlie Sporck, followed by Fred Bialek, Pierre Lamond, Ed Pausa and Don Valentine, similarly set back Fairchild's ability to manufacture effectively at low cost.) Take away technology and low cost manufacture, then chase out the marketing and sales

AMD & IC History 1969-84

1969

First 15 Years

IN THE BEGINNING

FEBRUARY 21, 1969:

The intercom buzzed.

"There's a guy on the phone who says he was referred by Bob Noyce. Needs a business lawyer. Want to talk to him?"

"This is Jerry Sanders. A group of us are starting a company and we're looking for a lawyer who knows something about how to do that to help us with it. Are you interested?"

"Absolutely. When would you like to come in and talk about it?"

"Three of us, John Carey, Ed Turney and I, are coming up to the City on Monday to interview some candidates for our attorney. When do you have time?"

"How about lunch, and then we can come back to the office to continue, if we need to?"

AMD & IC History 1969-84

AMD Founding | First 15 Years

MALIBU

Dec 1968: Malibu Colony Beach House (I know, I was there for my UCLA Xmas break.)

For the now somewhat depressing 1968 winter holidays, Sanders withdrew to one of his favorite spots in the world. In Malibu, in Southern California, he settled in to contemplate his situation and his future. The setting: a beach house with a $600 monthly rental tab, a princely sum for an unemployed sales type. Crucial momentum had been lost, and now at age 32, with three different jobs already behind him (McDonnell Douglas, Motorola and Fairchild) he needed a nimble and promising option just to stay even, much less to advance by this adversity. It was to be a recurrent formula for Sanders from that time on.

How better than to become president of a company? The somewhat annoying problem was that no presidency of an attractive company was open. But what shortly appeared to be open was the pathway to forming an entirely new company, whose presidency Sanders could occupy from the beginning.

AMD & IC History 1969-84

ENTER THE KING AND COURT

Two others, who went over the side at Fairchild shortly after Sanders, were an English production type named John Carey, and an old Sanders sales sidekick, Ed Turney. A phone call from Malibu to Lake Arrowhead, where Turney was formulating a plan to enter the real estate business, opened a dialogue on the subject of starting a company. Together, Sanders, Turney and Carey proposed to recruit a technologist to round out a strong digital bipolar semiconductor team. Their first choice, Clive Ghest, turned them down. Their second choice, a Danish-national technologist still at Fairchild, Sven Simonsen, agreed only after the application of a large measure of the Sanders' charm and persuasion. (Somewhat paradoxically, after Simonsen's departure from AMD in October, 1982, Ghest, who had himself joined AMD in 1971, left and then rejoined in 1975, took over Sven's title as Vice President and Technical Director.)

These four, it turned out, would be "a little more equal" than the other four founders, and would emerge as much more influential in the

Semiconductor Industry Assn

On the evening of March 16, 1977, in a private room in Ming's Chinese Restaurant in Palo Alto, California, these four met over dinner, together with Sanders' counsel, to plot strategy and form an organization to respond to the Japanese challenge. Within a week, incorporation papers were filed in Sacramento for the first ever, dedicated semiconductor trade group, the Semiconductor Industry Association. Included among the Directors on the incorporation papers, in addition to Noyce, Corrigan, Sanders and Sporck, was Motorola's John Welty, avidly recruited by Noyce to provide big company

AMD & IC History: SIA

First 15 Years

THE CRUDE OIL OF THE '80'S

For the longer term, it was clear that technological as well as political cooperation among U.S. manufacturers would be required. Its beginnings were already present in SIA's research arm, Semiconductor Research Corporation, founded in 1982, and the even more aggressive Microelectronics and Computer Corporation, initiated by Control Data Corporation's hard-charging CEO, Bill Norris. A key player respecting these initiatives was the U.S. antitrust establishment, whose first response under the Carter Administration was hostile. Thankfully, there later evolved a much more cooperative government attitude which was extended to support for 1984 legislation greatly liberalizing the rules for the safe conduct of joint basic research.

AMD & IC History: SIA

SIA in 1984

From these beginnings, SIA went on by 1984 to encompass more than 50 U.S. manufacturers and to develop and publish periodic international statistical reports on the semiconductor industry which include the Europeans, the Japanese themselves, and even Texas Instruments, which was one of the last holdouts. For a geographically concentrated industry with a relatively small employment base and no labor unions, the SIA established remarkable influence and credibility in Washington. Much of its program of increased research and development credits, resistance to tougher export controls and a form of copyright-like protection on semiconductor chip topography had been implemented, and there was much more to come.

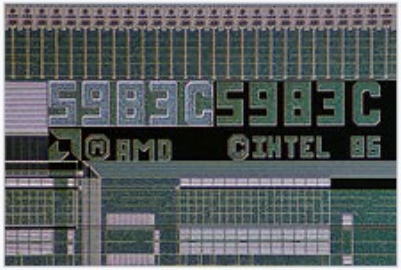
The jury had not even retired to deliberate yet on the question of comparative effectiveness of Japanese versus U.S. semiconductor manufacturers, but it was clear that in this case for the first time, the Japanese were up against a target which was responding in a timely and effective fashion to their challenge.

AMD vs. Intel Legal Battles

Litigation with Intel [edit]

See also: Intel Corp. v. Advanced Micro Devices, Inc. and Advanced Micro Devices, Inc. v. Intel Corp.

AMD has a long history of litigation with former (and current) partner and x86 creator Intel.[266][267][268]



AMD processor with Intel logo

- In 1986, Intel broke an agreement it had with AMD to allow them to produce Intel's micro-chips for IBM; AMD filed for arbitration in 1987 and the arbitrator decided in AMD's favor in 1992. Intel disputed this, and the case ended up in the Supreme Court of California. In 1994, that court upheld the arbitrator's decision and awarded damages for breach of contract.
- In 1990, Intel brought a copyright infringement action alleging illegal use of its 287 microcode. The case ended in 1994 with a jury finding for AMD and its right to use Intel's microcode in its microprocessors through the 486 generation.
- In 1997, Intel filed suit against AMD and Cyrix Corp. for misuse of the term MMX. AMD and Intel settled, with AMD acknowledging MMX as a trademark owned by Intel, and with Intel granting AMD rights to market the AMD K6 MMX processor.
- In 2005, following an investigation, the Japan Federal Trade Commission found Intel guilty on a number of violations. On June 27, 2005, AMD won an antitrust suit against Intel in Japan, and on the same day, AMD filed a broad antitrust complaint against Intel in the U.S. Federal District Court in Delaware. The complaint alleges systematic use of secret rebates, special discounts, threats, and other means used by Intel to lock AMD processors out of the global market. Since the start of this action, the court has issued subpoenas to major computer manufacturers including Acer, Dell, Lenovo, HP and Toshiba.
- In November 2009, Intel agreed to pay AMD $1.25bn and renew a five-year patent cross-licensing agreement as part of a deal to settle all outstanding legal disputes between them.[269]

Ryzen vs Threadrippper

David Rho, Partner at MMG Partners (2001-present)
Answered November 20, 2019

What are the differences between the Ryzen 9 3950X and Threadripper?

The main differences between Ryzen 9 3950X and (I assume the new) Threadripper is cores, PCIe lanes, Cache, and Memory bandwidth.

The Ryzen 9 3950X has 24 PCIe lanes of which 4 are to the chipset. Now I would like to point out that these are PCIe 4.0 lanes which are twice as fast as PCIe 3.0 so this is going to help get data in and out of the CPU much faster. The 3950X also has 16 cores and 32 threads spread out over 2 chiplets with a third chiplet acting as the IO die. And the 3950X supports dual channel memory configurations. This can become a constraint on the CPU as you need to feed so many cores but have limited memory bandwidth. The 3950X has 64MB of L3 cache.

The new Threadripper 3960X starts with 24 cores and the 3970X has 32 cores. These are spread out over 5 chiplets with 4 being the CPU cores and the 5th being the IO die. The CPU supports a total of 72 usable PCIe 4.0 lanes. These CPUs support quad channel memory and the rumor is that there will be another Threadripper CPU and Chipset the supports 8 channel memory. The 3960X has 140MB of cache and the 3970X has 144MB of cache, but that includes both L2 and L3 cache but doing the math, there is 128MB of L3 cache for each CPU.

The TL;DR is that Threadripper is more scalable than Ryzen, but then again the Threadripper is more expensive (CPU and MB) and the chips target slightly different markets. Think of the 2950X as a baby Threadripper that also works well in gaming (based on the reviews).

Products

Ryzen 9

How many transistors are in a Ryzen 9?

You have my answer on Intel i9 here: How many transistors are in core i9? - Quora

Googling I found this: Ryzen - Wikipedia

AMD is a bit of "cheating" cause they use several dies instead of one big like Intel.
AMD Ryzen is very simple. It always has IO die having 2.09 billion transistors and then number of CCDs (chiplet) each with two CCX and each CCX has up to 4 cores - 8 cores per CCD or chiplet.

Zen2 CCDs have up to 3.8 billion while Zen3 has up to 4.15 billion transistors.

I say up to cause some cores are disabled (malfunctioning).

So, Ryzen 9 3950x has 9.69 billion transistors while 5950x has 10.39 billion.

Ryzen 9 is nice chip to show how binning is important. Binning is process in fab when wafer is tested and various bins created. AMD manufacturers one or few identical wafers having CCDs but after testing CCDs do not behave identically, some support higher frequencies then other. Also some consume less power then others.
Notice this, 3900 has 12 cores, 3.8/4.6 GHz and is 105W. At same time 3950 has 16 cores, 3.5/4.7 GHz and is also 105W. That's binning!

When someone buys CPU he/she plays silicon lottery. It might get CPU which operates at specified frequencies but could also get one much better working on higher frequencies.

Identical is for memories, DDR. There are no 4600, 5000, 6000 or even 7000 DDR. They are "same" dies but memory manufacturers test each one, bin them, and use best ones for crazy DDRs.

AVX

Joe Zbiciak, I have been programming since grade school

Answered Sat

The VEX prefixes are used to encode the AVX and AVX2 vector instruction set extensions.

The EVEX prefix is used to encode the AVX512 vector instruction set extensions.

You don't typically ask for a VEX or EVEX prefix explicitly. Rather, the assembler emits prefixes as necessary when encoding instructions that require them.

Compilers will generate vector instructions when autovectorizing, or when the code explicitly requests vector instructions. You likely need to enable a certain level of optimization before the compiler will attempt autovectorizing. You likely also need to tell it to enable support for particular sets of instruction set extensions. Details vary by compiler.

Vector instructions speed up computation by performing many identical computations in parallel. These usually show up in data processing loops.

I realize that's vague. It's purposefully so. I've used vector techniques for graphics, matrix arithmetic, string processing, signal processing, cryptography, and so on. What all these applications have in common is that they loop over large quantities of data performing identical operations to many consecutive elements.

AMD

Current product lines [edit]

CPU and APU products [edit]

AMD's portfolio of CPUs and APUs as of 2020

- **Athlon** - brand of entry level CPUs (Excavator) and APUs (Ryzen)
- **A-series** - *Excavator* class consumer desktop and laptop APUs
- **G-series** - *Excavator* and *Jaguar* class low power embedded APUs
- **Ryzen** - brand of consumer CPUs and APUs
- **Ryzen Threadripper** - brand of prosumer/professional CPUs
- **R-series** - *Excavator* class high performance embedded APUs
- **Epyc** - brand of server CPUs
- **Opteron** - brand of microserver APUs[229]

Graphics products [edit]

AMD's portfolio of dedicated graphics processors as of 2017

- **Radeon** – brand for consumer line of graphics cards; the brand name originated with ATI.
  - **Mobility Radeon** offers power-optimized versions of Radeon graphics chips for use in laptops.
- **Radeon Pro** – Workstation Graphics card brand. Successor to the FirePro brand.
- **Radeon Instinct** - brand of server and workstation targeted machine learning and GPGPU products

Radeon-branded products [edit]

RAM [edit]

In 2011, AMD began selling Radeon branded DDR3 SDRAM to support the higher bandwidth needs of AMD's APUs.[230] While the RAM is sold by AMD, it was manufactured by Patriot Memory and VisionTek. This was later followed by higher speeds of gaming oriented DDR3 memory in 2013.[231] Radeon branded DDR4 SDRAM memory was released in 2015, despite no AMD CPUs or APUs supporting DDR4 at the time.[232] AMD noted in 2017 that these products are "mostly distributed in Eastern Europe" and that it continues to be active in the business.[233]

AMD

Technologies [edit]

CPU technologies [edit]

As of 2017 technologies found in AMD CPU/APU products include:

- **HyperTransport** - a high-bandwidth, low-latency system bus used in AMD's CPU and APU products
- **Infinity Fabric** - a derivative of HyperTransport used as the communication bus in AMD's Zen microarchitecture

Graphics technologies [edit]

As of 2017 technologies found in AMD GPU products include:

- **AMD Eyefinity** – facilitates multi-monitor setup of up to 6 monitors per graphics card
- **AMD FreeSync** – display synchronization based on the VESA Adaptive Sync standard
- **AMD TrueAudio** – acceleration of audio calculations
- **AMD XConnect** – allows the use of External GPU enclosures through Thunderbolt 3
- **AMD CrossFire** - multi-GPU technology allowing the simultaneous use of multiple GPUs
- **Unified Video Decoder (UVD)** – acceleration of video decompression (decoding)
- **Video Coding Engine (VCE)** – acceleration of video compression (encoding)

Software [edit]

- AMD Catalyst is a collection of proprietary device driver software available for Microsoft Windows and Linux.
- AMDGPU is AMD's open source device driver supporting the GCN architecture, available for Linux.

AMD

•• A partnership between AMD and Alpha Processor Inc. developed HyperTransport, a point-to-point interconnect standard which was turned over to an industry standards body for finalization.[254] It is now used in modern motherboards that are compatible with AMD processors.

•AMD also formed a strategic partnership with IBM, under which AMD gained silicon on insulator (SOI) manufacturing technology, and detailed advice on 90 nm implementation. AMD announced that the partnership would extend to 2011 for 32 nm and 22 nm fabrication-related technologies.[255]

•To facilitate processor distribution and sales, AMD is loosely partnered with end-user companies, such as HP, Dell, Asus, Acer, and Microsoft.[256]

•In 1993, AMD established a 50–50 partnership with Fujitsu called FASL, and merged into a new company called FASL LLC in 2003. The joint venture went public under the name Spansion and ticker symbol SPSN in December 2005, with AMD shares drop to 37%. AMD no longer directly participates in the Flash memory devices market now as AMD entered into a non-competition agreement, as of December 21, 2005, with Fujitsu and Spansion, pursuant to which it agreed not to directly or indirectly engage in a business that manufactures or supplies standalone semiconductor devices (including single chip, multiple chip or system devices) containing only Flash memory.

AMD's new Ryzen 7000 mobile processors include a massive 16-core chip

Story by Monica Chin • Yesterday 7:30 PM

Comments

This may seem like an underdog compared to Intel's top 13th-Gen chips, which have 24 cores — Intel has claimed that its Core i9-13980HX is the "world's fastest mobile processor". This chip, however, only has eight performance cores and 16 efficiency cores, while all 16 of the Ryzen's will be going full-speed ahead. This is essentially two full eight-core chips stuffed into one.

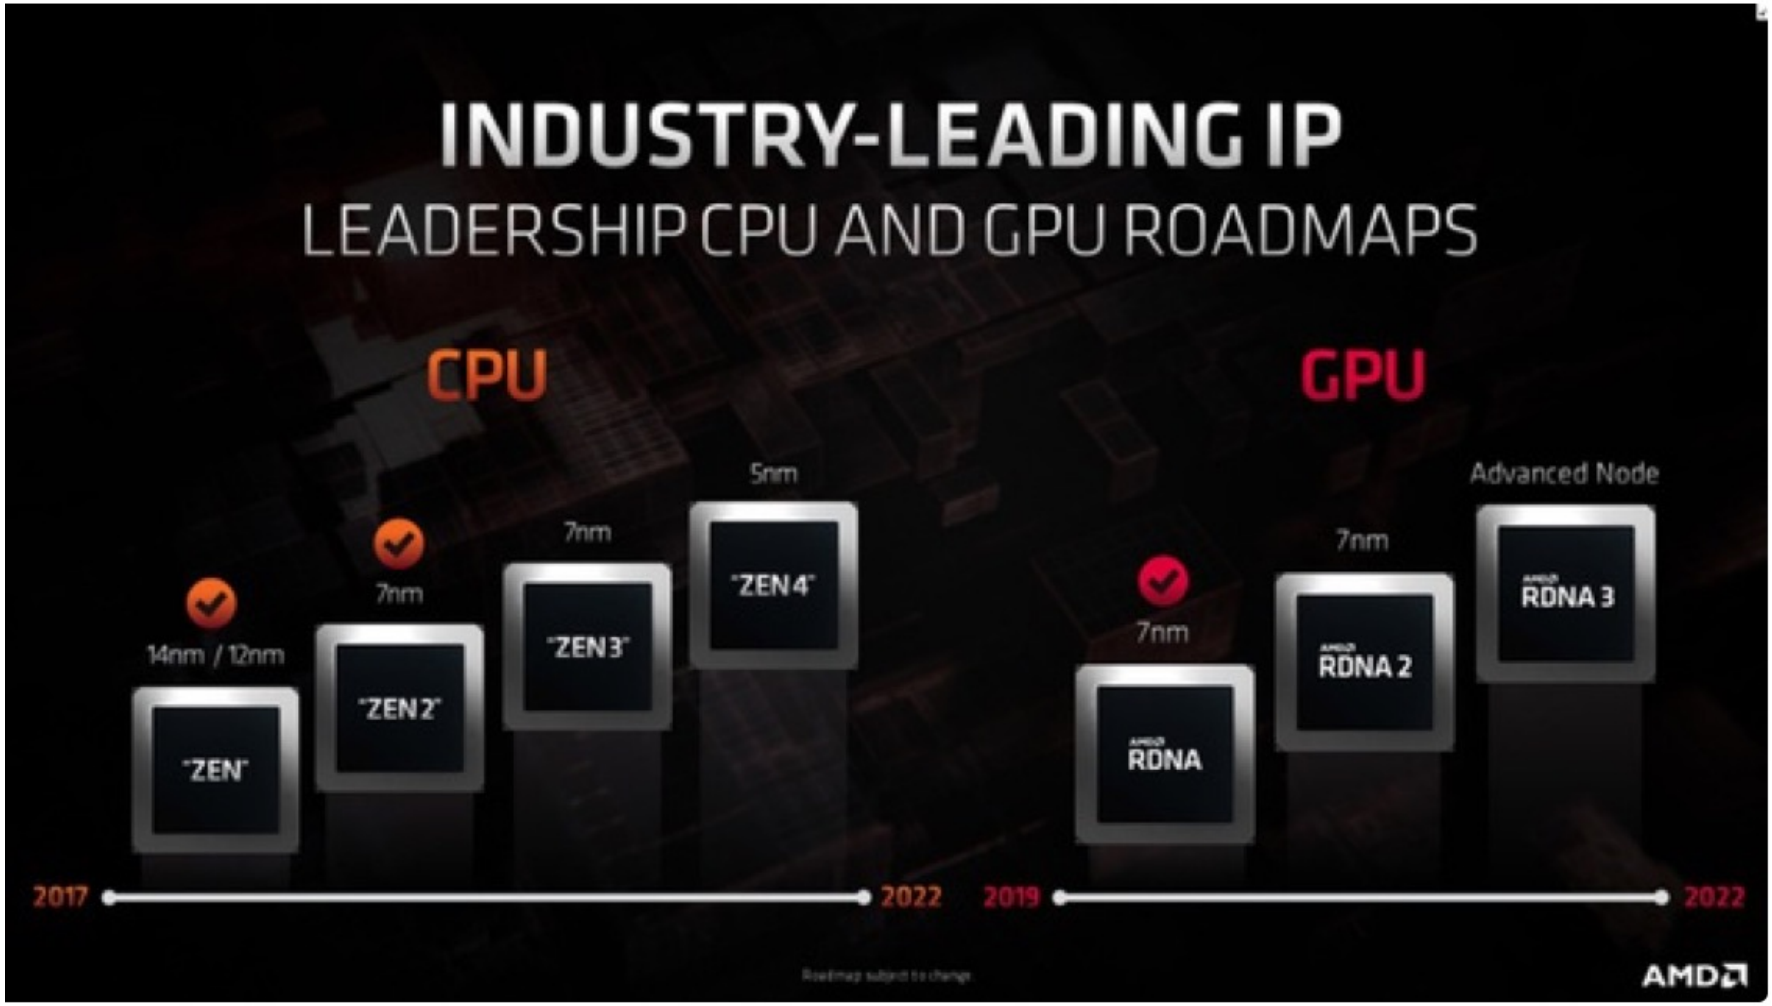
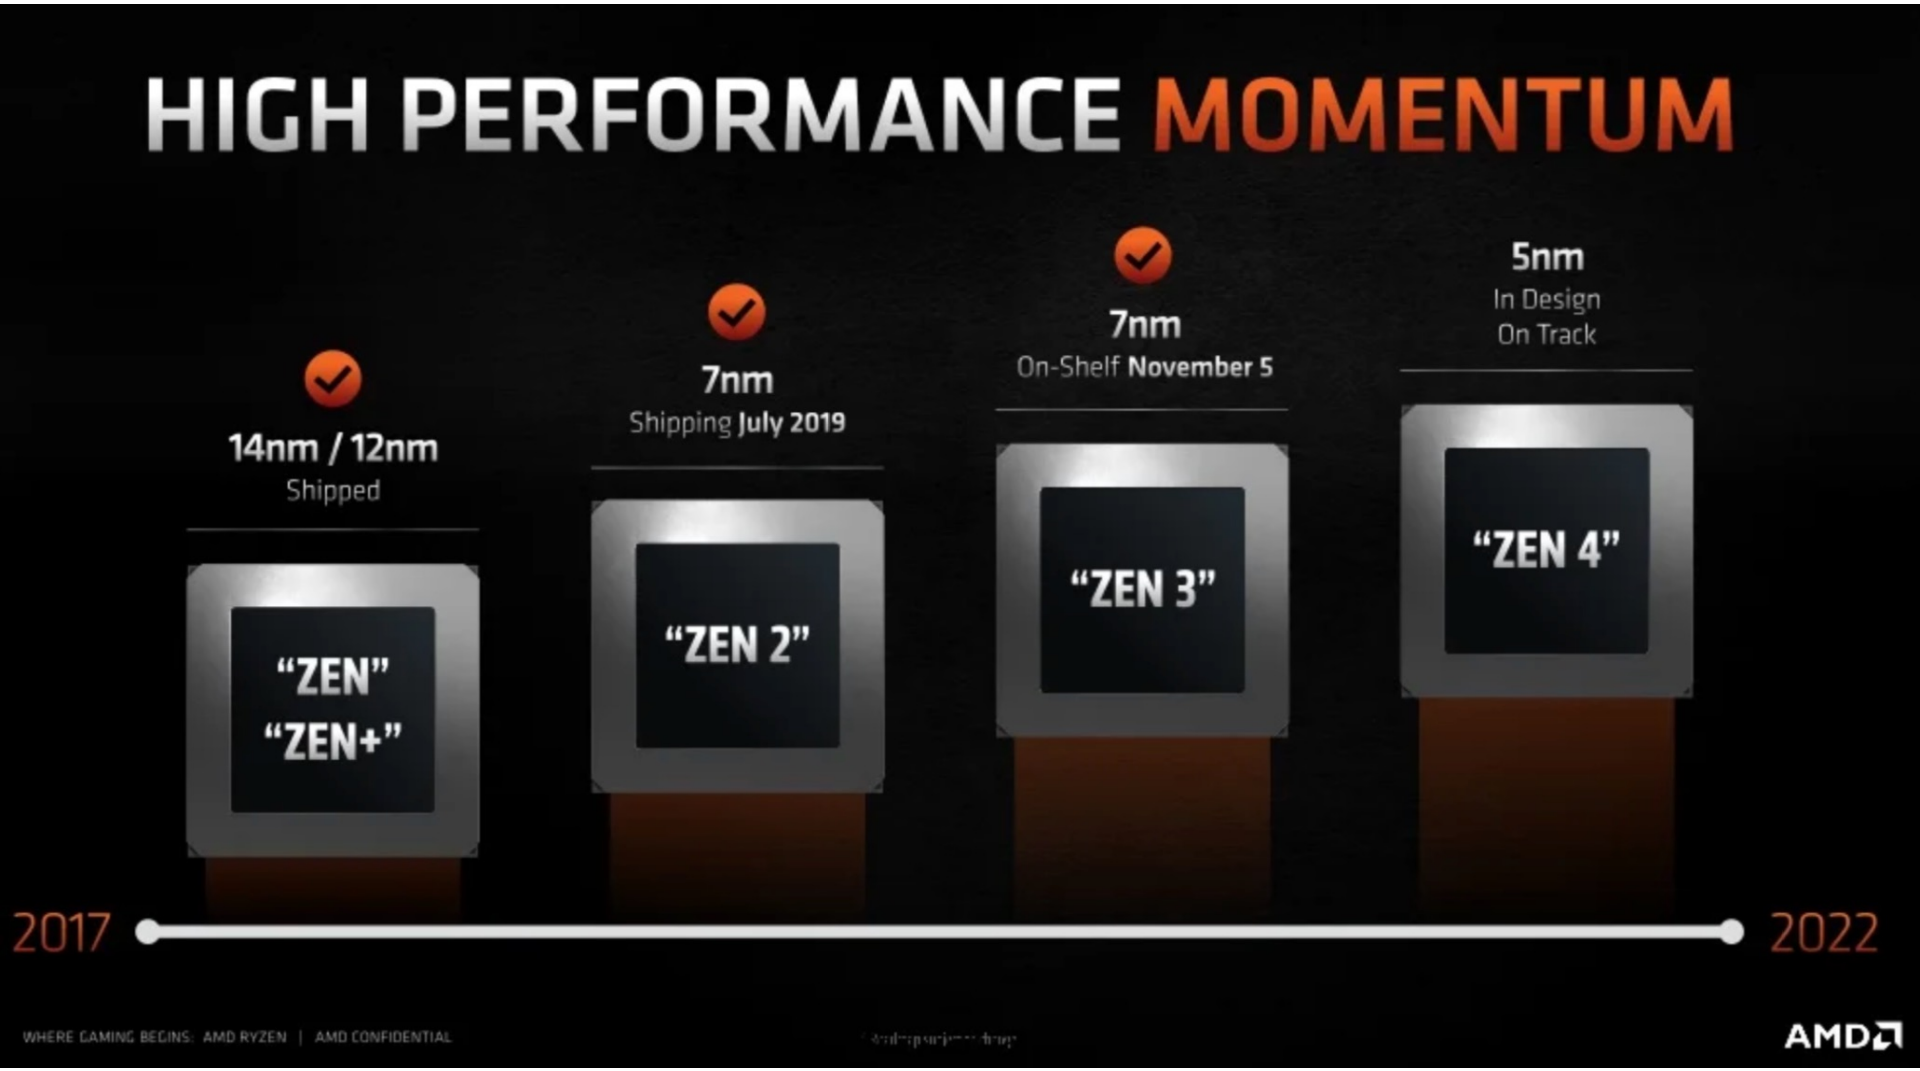
AMD Process Roadmap

When will AMD be transitioning to 5nm like Apple M1?

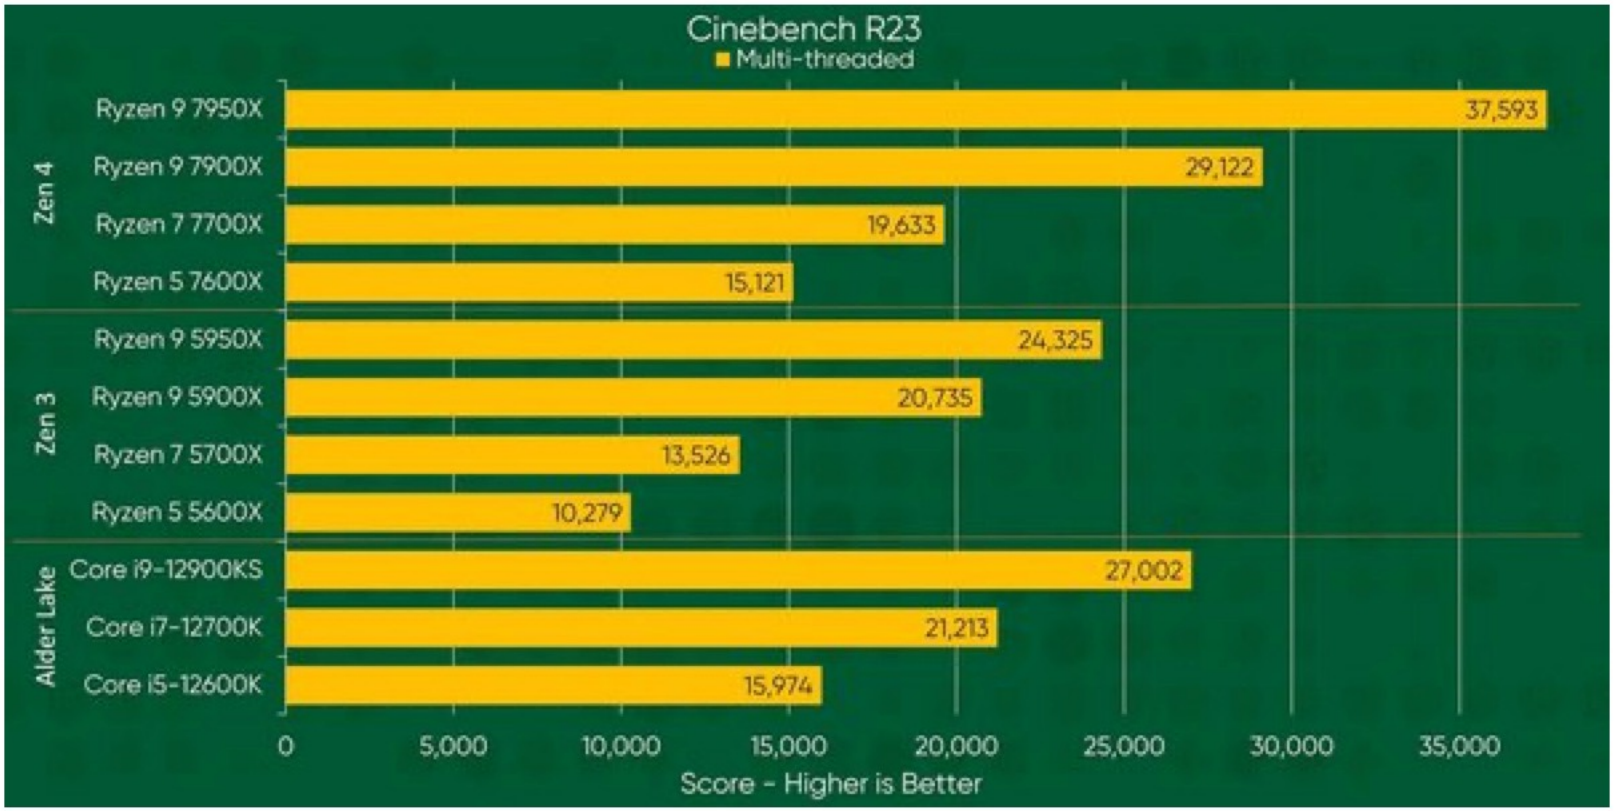


AMD Process Roadmap



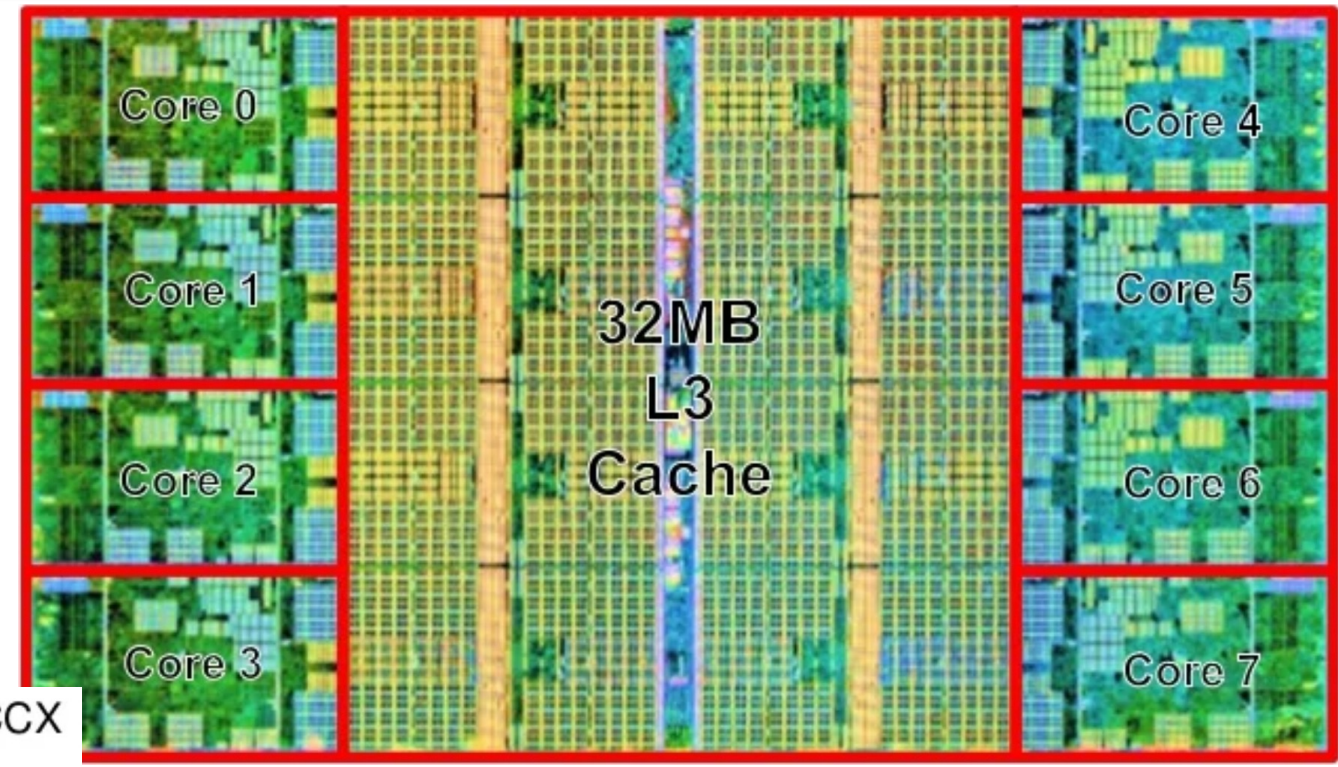
Zen 4 Benchmark

- Multi-threaded - here Ryzen leads cause it has more cores



➢ **Zen 4** is 50% better than Zen 3

AMD Zen 3 CCX



- Increased 4→8 cores per CCX
- Same max. 4MB of L3 per core
- Single CCX per chiplet
- 2x L3 cache directly accessible per core

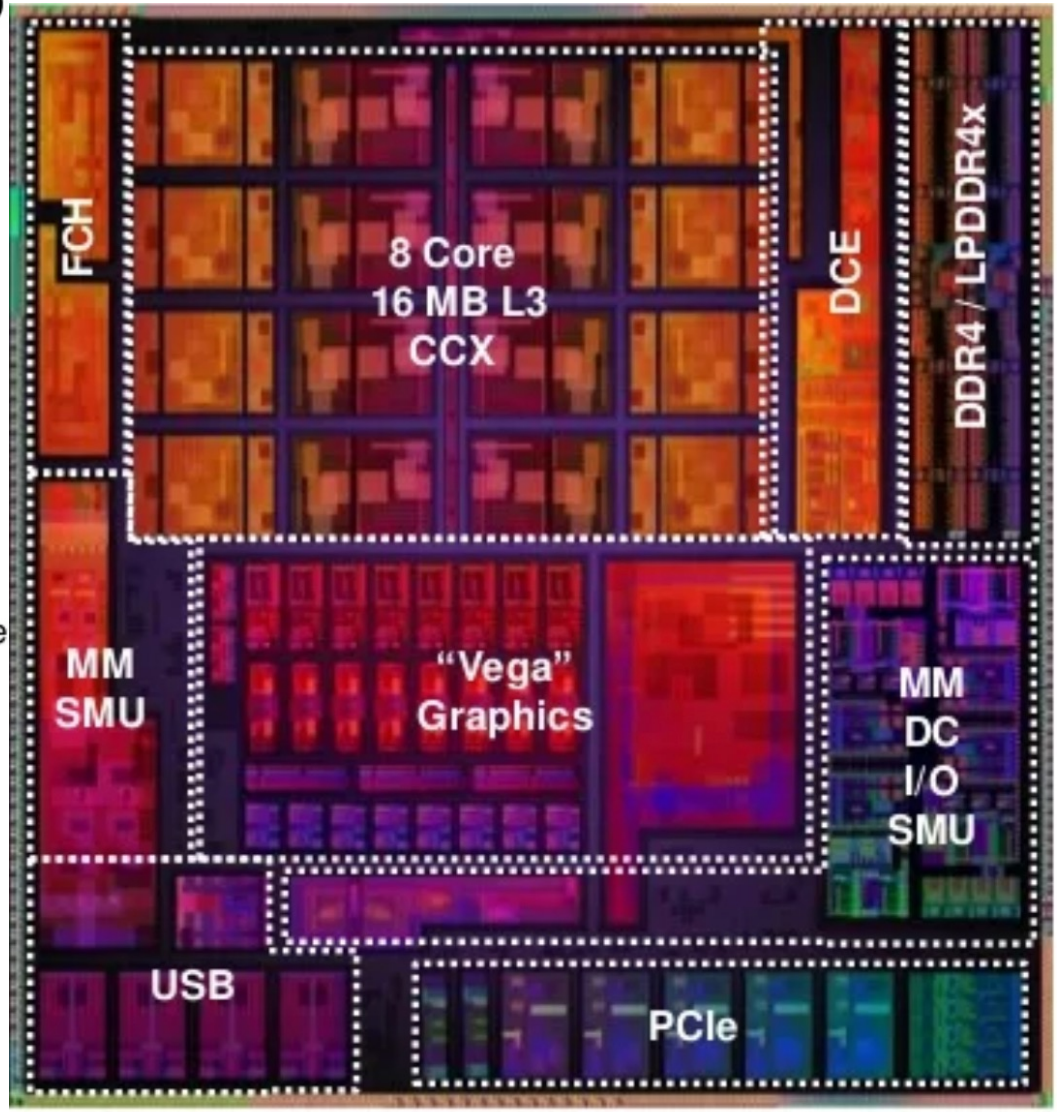
"Zen 3": AMD 2nd Generation 7nm x86-64 Microprocessor Core 2022

AMD APU

APU Monolithic Chip

Key chip features

- 8 core, 16MB L3 CCX
- 8 compute-unit ("Vega") graphics
- 2 memory controllers
  - DDR4 up to 3200 MT/s
  - LPDDR4x up to 4266 MT/s
- Multimedia (MM) engines
  - 2nd Gen Video Codec[1], 3rd Gen Audio ACP
- 2nd Gen display controller (DC)
- I/O controllers
  - PCIE® Gen4, USB-C, USB-3.1, USB-2.0, NVMe
- System management unit (SMU)
- Fusion controller hub (FCH)



180 mm² 10.7B Transistors (7nm)

AMD 3D V-Cache

AMD 3D V-Cache Ready

- Two columns of TSVs on left/right side of the L3 cache
- AMD 3D V-Cache extends L3 Cache capacity by 64MB (3x)
- Total inter-die bandwidth: >2 TB/s
- All control and routing to the cores is implemented on the base die, so AMD 3D V-Cache can be completely focused on density

AMD64

AMD
AMD64 Technology

Rev. 3.23—October 2020

AMD64 Architecture Programmer's Manual: Volumes 1-5

Overview of the AMD64 Architecture

The AMD64 architecture is a simple yet powerful 64-bit, backward-compatible extension of the industry-standard (legacy) x86 architecture. It adds 64-bit addressing and expands register resources to support higher performance for recompiled 64-bit programs, while supporting legacy 16-bit and 32-bit applications and operating systems without modification or recompilation. It is the architectural basis on which new processors can provide seamless, high-performance support for both the vast body of existing software and 64-bit software required for higher-performance applications.

The need for a 64-bit x86 architecture is driven by applications that address large amounts of virtual and physical memory, such as high-performance servers, database management systems, and CAD tools. These applications benefit from both 64-bit addresses and an increased number of registers. The small number of registers available in the legacy x86 architecture limits performance in computation-intensive applications. Increasing the number of registers provides a performance boost to many such applications.

New AMD Ryzen 5

UserBenchmark

AMD Ryzen 5 3600 $199

AMD's Ryzen 5 3600 is a 6-core, 12-threaded processor which succeeds the Ryzen 5 2600 improving upon it by 13% in terms of overclocked performance. The 3600 is in competition with Intel's 6-core i5-9600K. AMD continues to push the multi-core performance envelope: benchmarks show that the 3600 has a 27% overclocked 64-core lead over the 9600K but that the i5-9600K leads by 14% on single to hex core workloads which translates to 10% higher EFps in most of the today's top games (e.g. PUBG, GTAV and CSGO). Additionally, the 3600's memory controller, although significantly improved over previous Ryzen iterations, still has limited bandwidth and high latency which adversely impacts gaming. Weaknesses in memory architecture are not readily picked up by CPU benchmarks but they are apparent whilst gaming. Cheaper CPUs such as the 9400F deliver better gaming performance in nearly all of today's popular games. At $190 USD, the

Zen 3

6 CPU cores (SMT-12)

AMD Ryzen 5 5600X $300

The Ryzen 5 5600X is both the entry-level and best value for money 5000 series CPU. The 5600X is a hex-core 12 thread processor with a base clock speed of 3.7 GHz boosting to 4.6 GHz. It has 35 MB of cache and a TDP rating of 65W. A cooler is included in the MSRP of $300 USD, but cheap after-market coolers (such as the $20 GAMMAXX 400) are far more effective and therefore worth the upgrade. Notably, AMD's new Zen 3 architecture has vastly improved single-core performance and lower memory latency, which leads to a significant effective speed advantage over its predecessor, the 3600X. Last year, AMD's marketers secured significant sales of the 3000 series CPUs despite a 15% performance deficit against lower priced Intel parts. The games, specific scenes,

AMD made radical alterations to its Zen design while keeping itself distant from an ugly past. The company knew it had to make the changes to become a force to reckon with in the server and PC markets. So when the designers of the chip sat down to map the Zen design, they had two priorities: To boost CPU performance to maximum and to stabilize power efficiency.

According to a company spokesperson, the chips will come with 8 to 32 cores. The 32-core chips may come in the quad-CPU configurations although those details haven't been finalized yet.

AMD Ryzen

Norman Latifov, knows Turkish
Answered 2h ago

It is the latest mobile CPU from AMD. Ryzen 4000 CPUs are only available on laptops and they are the fastest mobile CPUs available right now. I am using a Lenovo Yoga slim 7 with r7 4800u and before I bought it I did a lot of research. Based on reviews, they are even faster than 11th gen Intel CPUs that are yet to come. Although their integrated GPU is not as good as iris graphics (Intel 11th gen CPUs' integrated GPU), vega series GPUs are still a good option. And in my opinion, ryzen 4000 CPUs have a great multicore performance.

Zachary Hawkshaw, AMD Hardware Connoisseur
Answered 10h ago

I don't know where you got your information, but that's not true. The 2700X only has 4.8 billion transistors while the 3700X has 19.2 billion.

Transistor count doesn't necessarily mean more performance by itself. The 3700X is better because it has a newer architecture (Zen2 vs Zen+) with improvements to the Infinity Fabric, as well as a higher turbo frequency.

AMD Ryzen

John B. Anderson III, IT Consultant, PC Integrator, 20+ Years in IT and Gaming.

Answered Mon

Well, it's only on the Laptop side... Since they skipped it to make them both match desktop/laptop for Zen 3 architecture.

Laptops with the 4XXX name are actually Zen 2 processors.

See some guy in marketing thought it'd be a good idea to call Zen processors on laptops 2XXX series, and so when the 2XXX series came out on desktop the laptop was already at 2XXX so they called them 3XXX.

Example Desktop CPU Ryzen 5 2600x the laptop version would be a Ryzen 5 3550h

AMD Ryzen 5 2600 vs 3550H with the typical lower performance on laptop vs desktop CPU. Same Zen+ architecture in both.

On the Zen 2 Archetuxture

AMD Ryzen 5 3600 vs 4600HS we see the Ryzen 5 4600 HS ~5% of the speed.

There are no Zen 3 laptop processors as of the time I'm writing 11/2020

Typically we call it a "Gen / Generation" when they name a model with a change in the first digit.

Example Core i5 10XXX would be a 10th gen i5. Ryzen 7 1800x would be a 1st Gen Ryzen, However, Since the laptops, 4XXX were the only "Gen 4s" but they were technically Gen 3's well the answer is somewhat tricky.

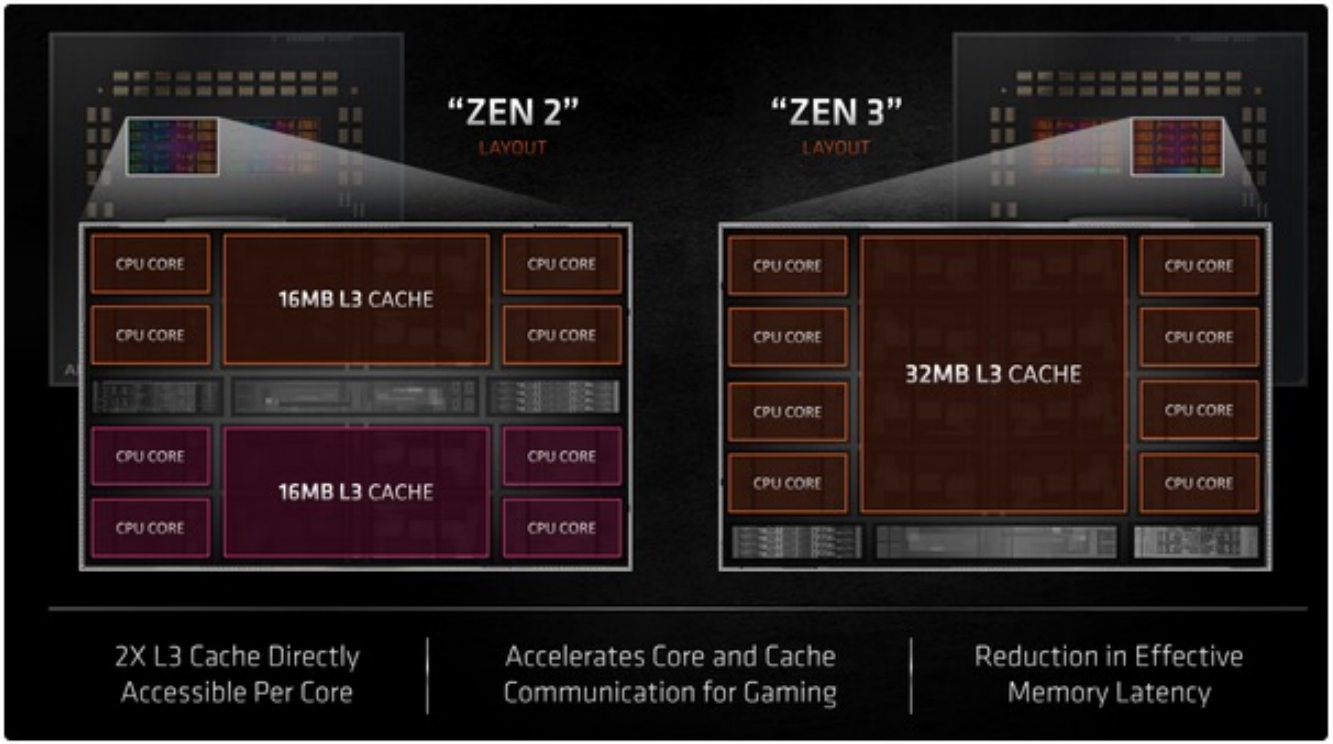
AMD Zen L3 Cache

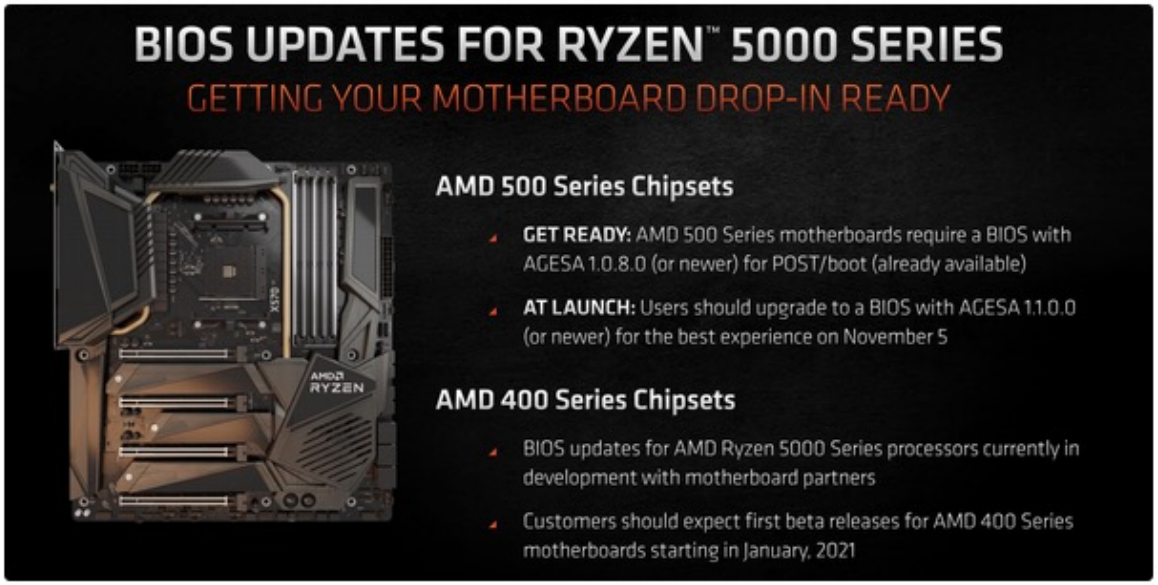
One area that AMD has lagged behind Intel over the lifetime of the Zen brand is in gaming performance. It's no secret that in the company's push to lower the cost per core of its flagship processors (through the introduction of chiplet-based architectures), the design decisions have resulted in more latency between core complexes. That manifests itself in reduced performance in certain PC gaming scenarios--especially at the favored 1080p resolution used by most gamers.



This is down to how chips are designed, and, more specifically, how they're laid out on

AMD Zen 3

Another way that AMD looks poised to continue its winning streak over Intel is in its platform and required socket adoption for new PCs, PC builds, and upgrades...or rather, its of required adoption. Instead of forcing buyers onto a new motherboard platform with a new style of CPU socket every other generation of chips (the typical cadence in recent years for Intel's desktop processors), Zen 3 will mark the third launch in the Zen line to feature some level of compatibility with motherboards based on the now-venerable Socket AM4.

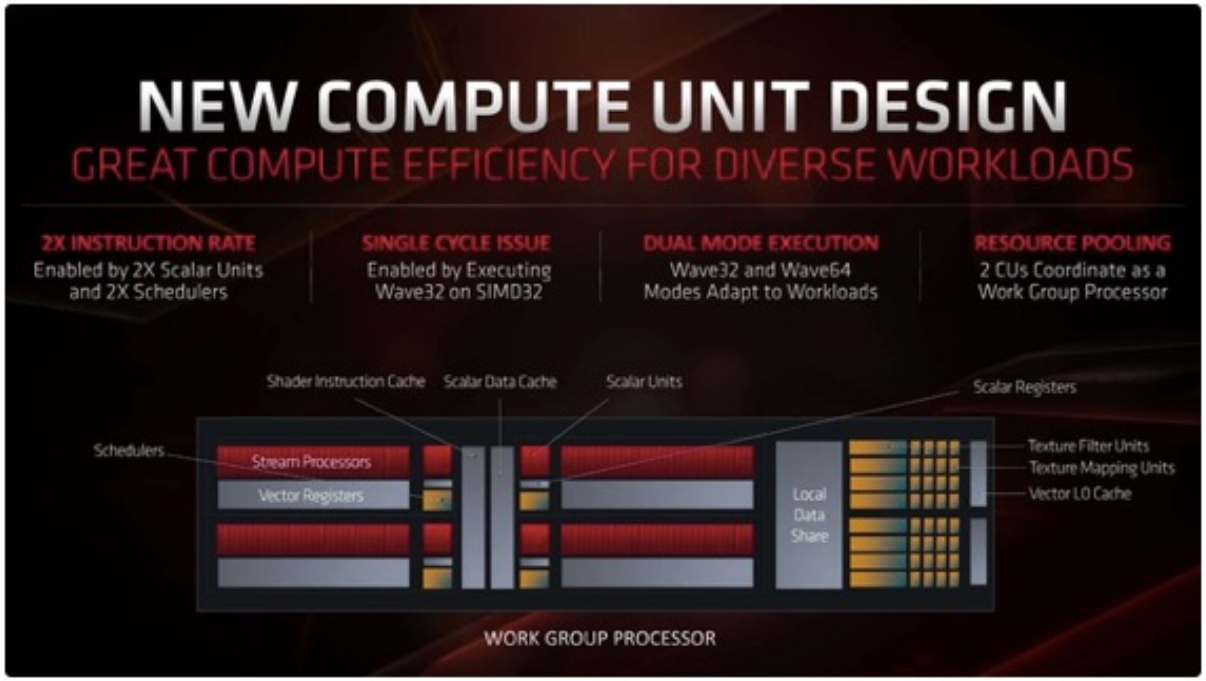


The one caveat? Unlike Zen 2, which is compatible with just about AM4-based motherboard, the cutoff for Zen 3 is a bit higher up the chipset stack this time. The new CPUs will work only with motherboards from the X470, B450, and later chipset generations. (That includes the new X570 and B550 boards.) Plus, it's down to motherboard manufacturers to make it work, issuing the proper updates.

Back in May, the company clarified Zen 3 AM4 compatibility, claiming that a BIOS update would be required for any users of either X470 or B450 motherboards. Now, we

AMD Zen Cores

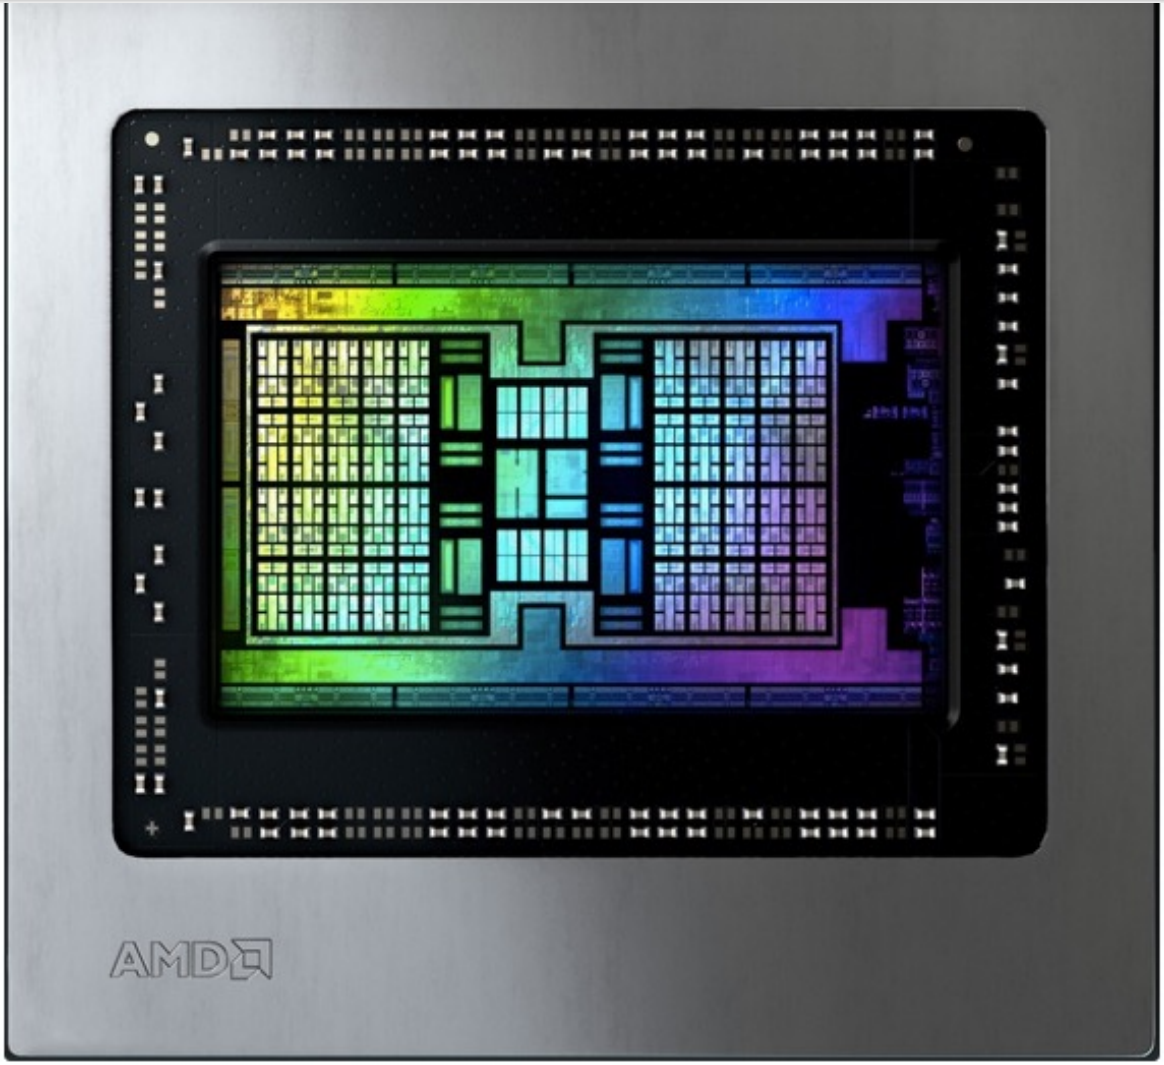
Each core (DCU) has four 32-lane SIMD units, so that it each core can perform 128 32-bit floating point multiply-accumulations(FMAs) per clock cycle and the whole chip 5120 32-bit FMAs per clock cycle.



But each Zen2 or Zen3 CPU core also has 2 256-bit (8-lane for 32-bit) SIMD FMA units, so that each core is capable of calculating 16 32-bit FMAs per clock cycle, so for 8-core CPU such as 3800X or 5800X, the whole chip can perform 128 32-bit FMAs per clock cycle.

So, the core count difference between CPUs and GPUs is not many hundreds of times in reality, it's less than 10 times, and the difference in parallel execution units is only about 20-40 times, not hundreds of times.

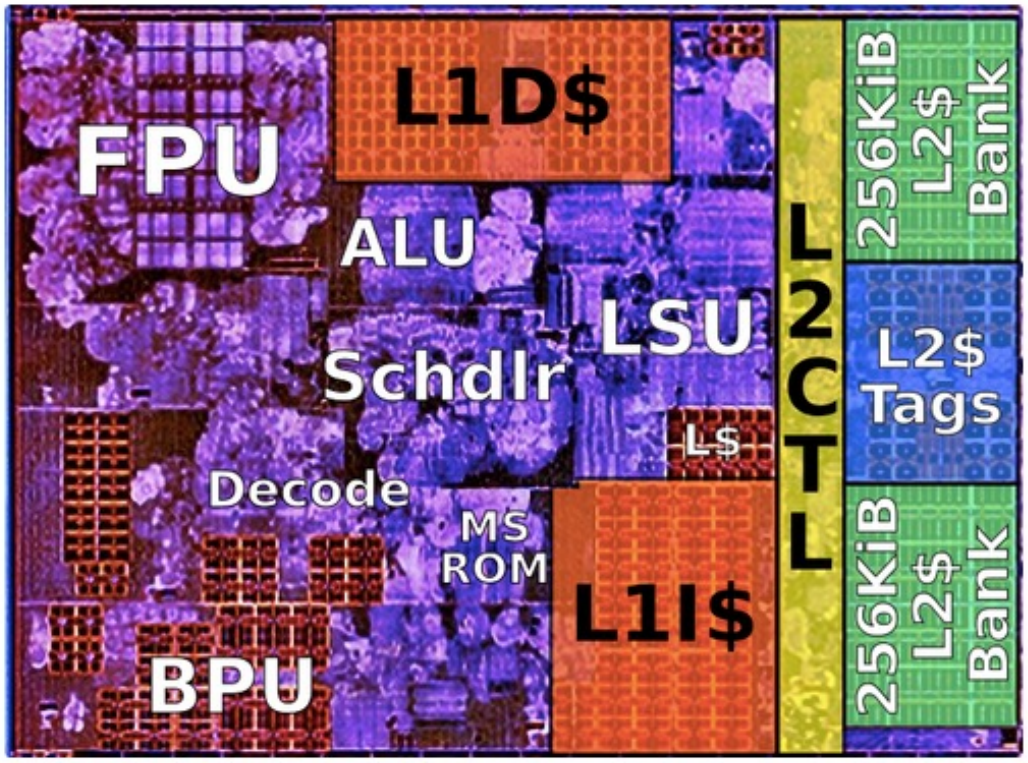
AMD Zen Cores



Each core (DCU) has four 32-lane SIMD units, so that it each core can perform 128 32-bit floating point multiply-accumulations(FMAs) per clock cycle and the whole chip 5120 32-bit FMAs per clock cycle.

AMD Zen Cores

To make the CPUs execute the serial code as quickly as possible, they have very big and complex cores which have things like very advanced branch predictors and huge caches to minimize time wasted for stalls. The actual execution units are only very small part of the transistor count or area of the core.



Here is a picture of AMD Zen core. The very small part "ALU" consists all the execution units for most commonly used integer instructions, and FPU is mostly the execution units of the floating point and SIMD instructions. L1D$, L1I$ and L2$ are cache memory, BPU is branch prediction unit which just tries to guess what the core should do next to minimize stalls.

AMD EPYC Genoa Pictured: 12 CPU Chiplets For 96 Zen 4 Cores

By Anton Shilov published 2 days ago

Since AMD's SP5 processor packaging is huge to enable 12 memory channels and higher thermal design power (up to 700W, according to some leaks), there is a lot of space for CPU chiplets and an I/O die. Indeed, we see 12 chiplets, each carrying eight Zen 4 cores. The flagship Genoa chip packs 96 cores, 192 threads, and AMD's next-generation I/O die supporting PCI Express 5.0 and several other innovations. However, AMD will also launch different SKUs with fewer cores; therefore, some of those chiplets will likely come disabled on some models. Another discovery on the chip is a rather complicated power delivery system with eight rows of capacitors.

Meanwhile, since the chiplets and the I/O die look too thick, we would say that the published image depicts a mockup of AMD's next-generation server processor rather than a sample of the product. Nonetheless, the photograph still shows AMD's Zen4-based EPYC 7004-series CPU without its integrated heat spreader.

AMD CPU's in PS5

7nm Ryzen

PS5 Specs: Rumors and Current Predictions

Before we dive into our in-depth look at potential PS5 specs, lets start with the current predictions. The system's architect, Mark Cerny, revealed some official details in April 2019, but the exact specs still remain a mystery. Here is what we know from that reveal:

- PS5 will support up to 8K resolutions
- The system will include an SSD that will drastically reduce load times
- Ray tracing (a powerful graphics technique) is supported by PS5
- The system uses a variation of AMD's third generation Ryzen with eight cores of the new 7nm Zen 2 microarchitecture
- GPU is a variation of the Radeon Navi family
- The system provides 3D audio without any additional hardware

AMD CPU's in PS5

7nm Ryzen

These are our current spec predictions based on rumors and what was revealed by Mark Cerny:

- CPU: 8 core/16 threads at 3.2Ghz with a Zen2 architecture
- GPU: Navi-based with AMD next-gen features at 12.6 to 14.2 teraflops
- Memory: 24GB total with reportedly 20GB GDDR6 at 880GB/S and 4GB DDR4 for the operating system
- 2 TB SSD

External GPU Box

Nvidia GEFORCE RTX

The RTX 3090 will be the first 350W GPU form NVIDIA in quite a few years, possibly the biggest power hog ever. That to me does not seem like a step in the right direction. Part of that will be due to the also-very-hungry 24GB of GDDR6X. But the overall performance per watt ratio won't really be any better than the RTX 2080 Ti. A projected 39% boost in performance for a 40% boost in wattage.

It will probably be better than that, but not by a large amount.

I have long imagined a double sided GPU with cooling fans and heat sinks on both sides. The 3080/3090 FE will actually be double-sided to some degree as rumors point to a possible VRAM cooler mounted to cool the back of the PCB

Bob McConnell · Sat
Former Vice President, Embedded Processors at Advanced Micro Devices (company) (1989–1999)

Will Intel and AMD start making ARM processors to catch up with Apple?

Apple will not try to compete with Intel and AMD at the chip level. The PC market and the PC processor market has several things going on.

1. Apple has innovated and PC laptop makers like Dell, Lenovo, HP, and Acer will want some way to compete with Apple MacBooks. We have not yet seen the software that will soon come using the M1's neural engine.
2. Windows is a huge market and Microsoft has to decide how to proceed. Do they make a real serious attempt to create an ARM version? There are huge legacy issues, so they probably would have to make a second version of Windows to run on ARM. I think the laptop world is getting decided right now, but the desktop world may take a while.
3. Intel and AMD have built serious x86 processors for a long time. They'd love it if Microsoft stuck to x86 for Windows, but probably they will have to create ARM based processors. That's not a huge problem as ARM will license cores to anybody, but it'll open a new area of competition and a new area where things might go in different directions.

There is even room for some other company to jump into the processor market based on ARM and really stir the pot. But it won't be Apple.

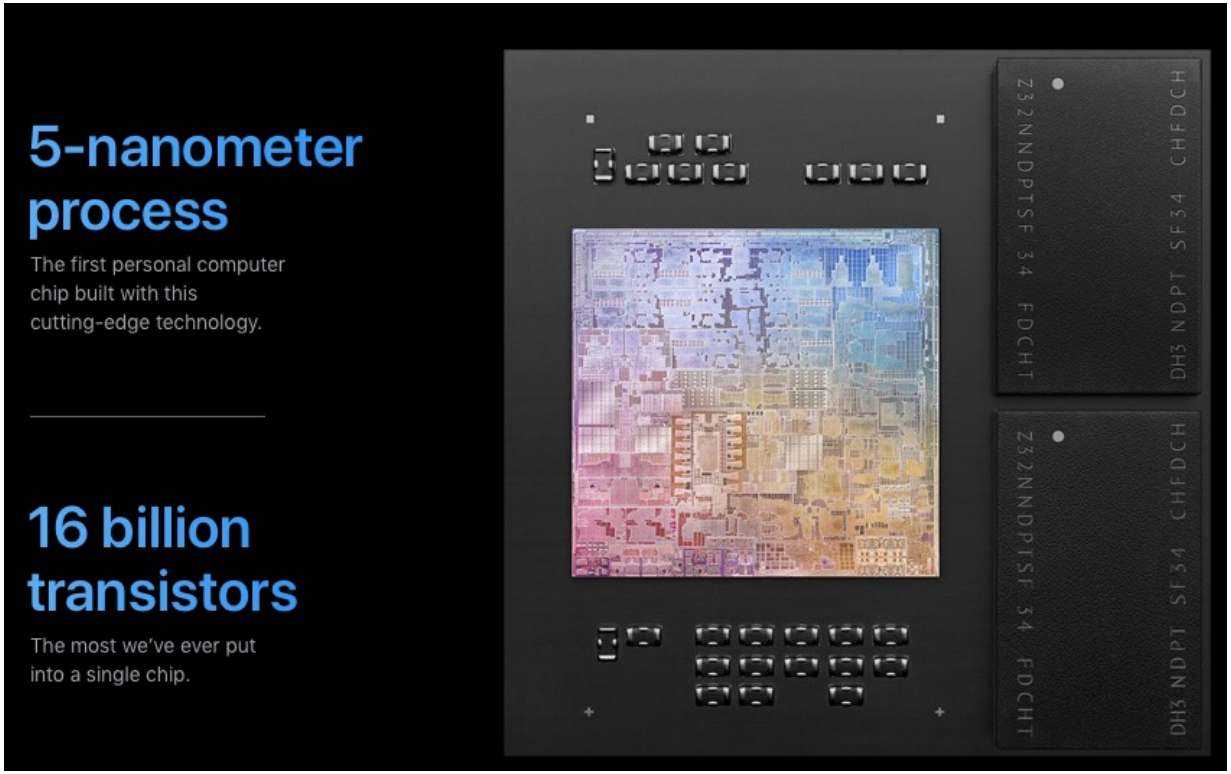
My Response to Apple

Jeff Drobman · 2m ago

hey Bob, Apple has taken the lead in both process node at 5nm, giving them a new record of 16B transistors on the new M1 (even though the die is huge at 1″). they have innovated architecture for AI by adding 16 NPU cores along with extra ML accelerators. Intel and AMD have to decide how important AI is to their customer bases. this is way more significant than which ISA is used (IMHO).



625 sq mm?
(= 1 sq in)

CPU – Serial

The answer to the question

But why CPUs and GPUs are different in their parallelism:

Because their are made to run different code.

CPU - serial

CPUs are made to run normal programs, written on normal programming languages, and to be able to handle ANY code.

Almost all common programming languages which are used to write normal programs are based on programming paradigms that are inherently serial - they consist of sequential operations. This stream of serial operations cannot be be efficiently parallelized in generic case, as the next operations very often need the results of the previous operations. Typically only very small parts of most programs can be automatically parallelized for multiple cores by the compiler. To parallelize most of the code for even few cores, the programmer has to do extra work for writing multi-threaded code (which is much harder, less productive and bug-prone).

So, CPUs are optimized for handling the serial code as quickly as possible. Because, for most programs, the is what really matters. If the parallel part is only half of the program, even if you have million cores and parallelize the code for those million cores, you are still spending half of the original execution time in the serial part, so you still are not even twice as fast as originally.

GPU – Parallel

GPUs - parallel

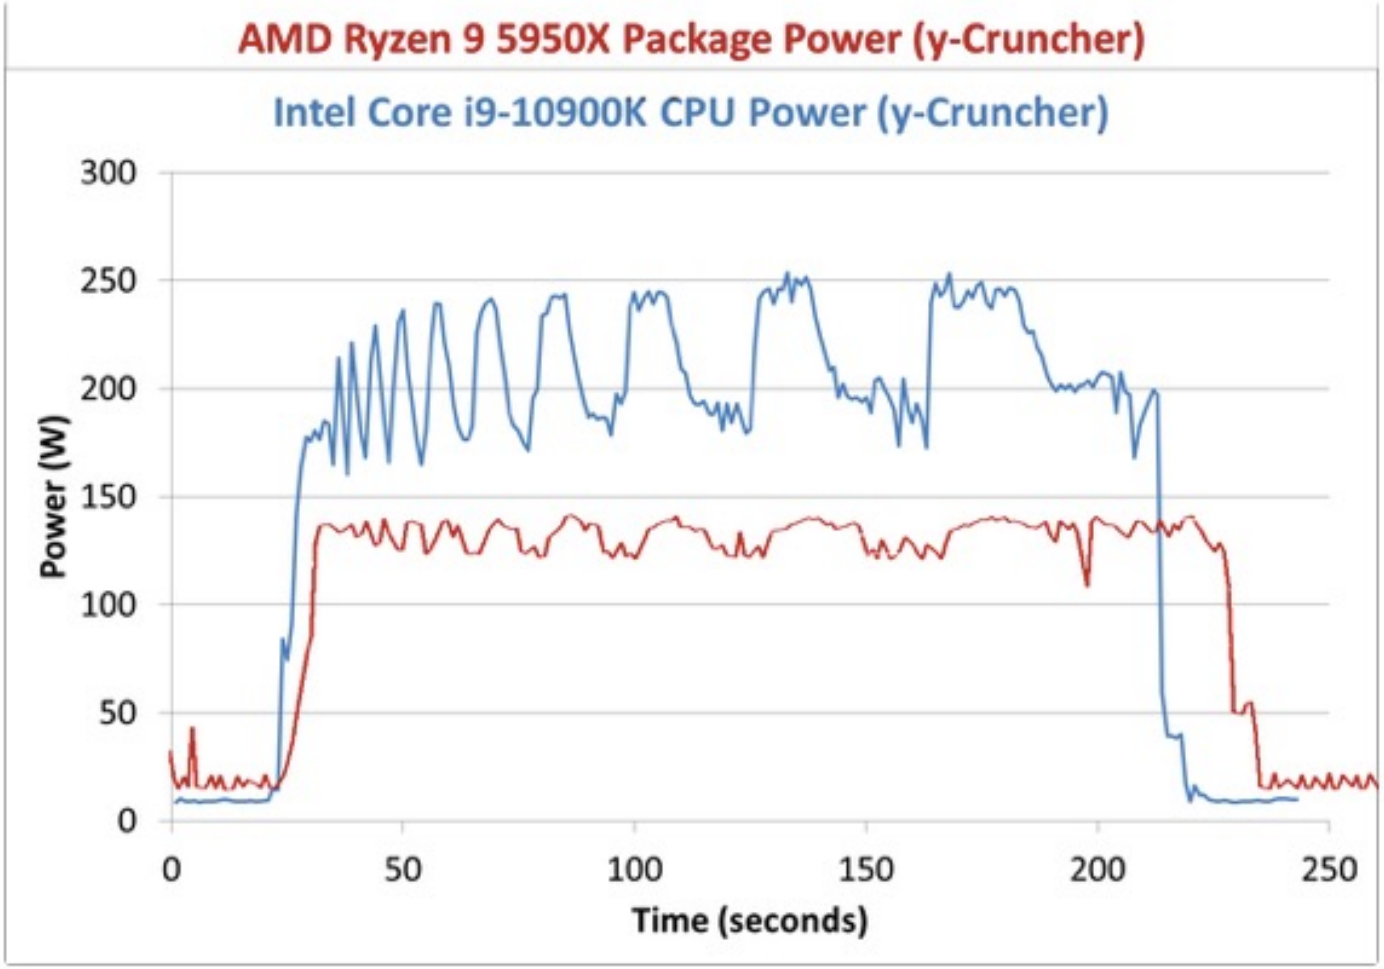
GPUs, on the other hand, are highly specialized for executing parallel workloads. They cannot even practically run whole programs. Only the small parts of the programs which are highly parallel can be sent to be executed in the GPU, and to do this, the programmer typically has to do lots of work the make his/hers code execute on the GPU.

Drawing the pixels to the screen is one of those very rare things which are very highly parallel - if the screen has 8 million pixels, and lots of calculations have to be done per pixel, theoretically colors of all the 8 millions pixels could be calculated in parallel.

Because of the highly parallel nature of graphics, these parallel processing units emerged as Graphics Processing Units(GPUs), even though for the last >10 years they have been also able to calculate parallel code that has nothing to do with graphics.

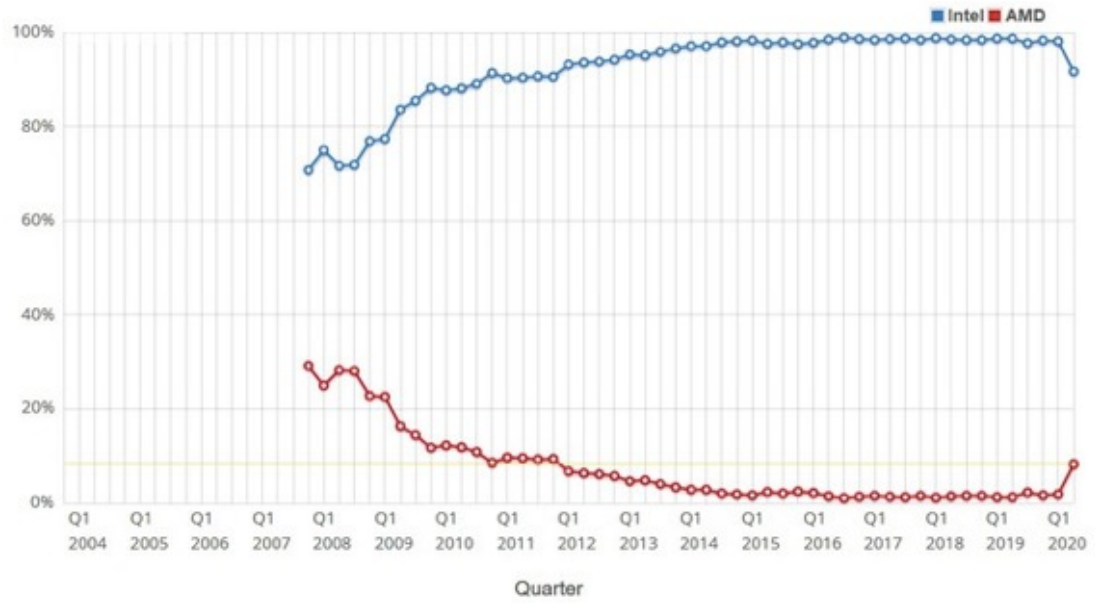
Ryzen vs. i9: Power (TPD)

With the release of the Ryzen 5000 series, there is literally no reason to go for Intel's 10th gen Comet Lake chips (which still use the 2015 Skylake cores) given that AMD dominates single and multithreaded performance at every tier while their chips draw way less power and dissipate less heat.



Epyc: *Server* Mkt Share

One motherboard with a pair of EPYC's is $15,000. This is very big pill for a small IT department to swallow. Widespread adoption is going to be gradual, but you can already see in the graph you cited that AMD's share in the server market is its highest since 2011.



As I have discussed at length in recent posts, AMD architecture of the past decade has been horrible for efficiency, and thus entirely unfit for the server sector where efficiency and reliability are of the utmost importance.

EPYC 2 is extremely efficient and reliable. EPYC 3 will certainly be even more so. For AMD to make the leap that it has in 2020 is almost unprecedented in the history of computing. You might say that its installed base has leapt 500% in one quarter. At what time in history has any company ever increased its market share by 500% in three months? You might rightly say that its growth in 2020 is almost unprecedented in the entire history of commerce.

Epyc for Servers

Customers like Twitter and Google are thrilled to have such powerful and compact options like the dual-EPYC (128-core, 256-thread 2U rackmount blades) that can in some cases replace an entire cabinet of old Xeon server blades while using a tiny fraction of the wattage.

Custom APUs [edit]

As of May 1, 2013, AMD opened the doors of their "semi-custom" business unit.[175] Since these chips are custom-made for specific customer needs, they vary widely from both consumer-grade APUs and even the other custom-built ones. Some notable examples of semi-custom chips that have come from this sector include the chips from the PlayStation 4 and Xbox One.[176] So far the size of the integrated GPU in these semi-custom APUs exceed by far the GPU size in the consumer-grade APUs.

Chip (device)	Release date	Fab	Die area (mm2)	CPU				GPU			
				Archi-tecture	Cores	Clock (GHz)	L2 cache	Archi-tecture	Core config[a]	Clock (MHz)	GFLOPS [b]

AMD APU's

28nm 2016

I-Family: "Brown Falcon" (2016, SoC) [edit]

- Fabrication 28 nm
- Socket FP4[166]
- 2 or 4 Excavator x86 cores with 1MB shared L2 cache
- L1 Cache: 32 KB Data per core and 96 KB Instructions per module
- MMX, SSE, SSE2, SSE3, SSSE3, SSE4.1, SSE4.2, SSE4a, AMD64, AMD-V, AES, CLMUL, AVX, AVX 1.1, AVX2, XOP, FMA3, FMA4, F16C, ABM, BMI1, BMI2, TBM, RDRAND
- GPU microarchitecture: Graphics Core Next (GCN) (up to 4 CUs) with support for DirectX 12
- Dual channel 64-bit DDR4 or DDR3 memory with ECC
- 4K × 2K H.265 decode capability and multi format encode and decode
- Integrated Controller Hub supports: PCIe 3.0 1×4, PCIe 2/3 4×1, 2 USB3 + 2 USB2 ports, 2 SATA 2.0/3.0 ports

Model	Released	Fab	Stepping	CPU						GPU					Memory support

Tools & SDKs

AMD Zen Software Studio

AMD Optimizing C/C++ and Fortran Compilers ("AOCC") — The AOCC compiler system is a high performance, production software generation tool optimized for AMD processors based on the AMD "Zen" core architecture.

AMD µProf — AMD µProf is a suite of powerful tools that help developers optimize software for performance and power, optimized for AMD processors based on the AMD "Zen" core architecture.

AMD Optimizing CPU Libraries ("AOCL") — AOCL is a set of numerical libraries optimized for AMD processors based on the AMD "Zen" core architecture.

Other SDKs and Tools

Tools for DMTF DASH — DASH (Desktop and mobile Architecture for System Hardware) is a client management standard released by the DMTF (Distributed Management Task Force). DASH is a web services based standard for secure out-of-band and remote management of desktops and mobile systems. Client systems that support out-of-band management help IT administrators perform tasks independent of the power state of the machine or the state of the operating system.

AMD Optimizing C/C++ Compiler

NEW! AOCC 3.0 is now available

Downloads User Guide

The AOCC system is a high performance, production quality code generation tool. The AOCC environment
C++ and Fortran applications targeting 32-bit and 64-bit Linux® platforms. The AOCC system offers advanc
global optimization, vectorization, inter-procedural analyses, loop transformations and code generation. AM
from each x86 processor core when utilized. The AOCC suite simplifies and accelerates the development a

AOCC offers:

- Enabled, tuned and optimized for AMD EPYC architectures
- Based on LLVM Compiler Infrastructure
- Tuned for AMDLibM (AMD Math library)
- Flang as the default Fortran front-end with added F2008, Real 128 features
- Debugging support for clang/clang++ DWARF5 standards
- Debugging support for Flang DWARF4 standards
- Improved debugging support for FORTRAN arrays and pointers.

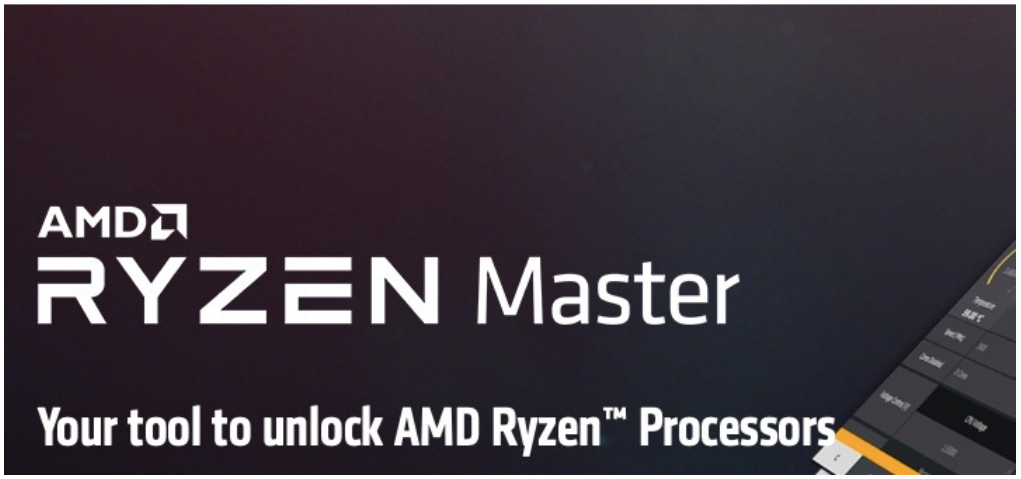
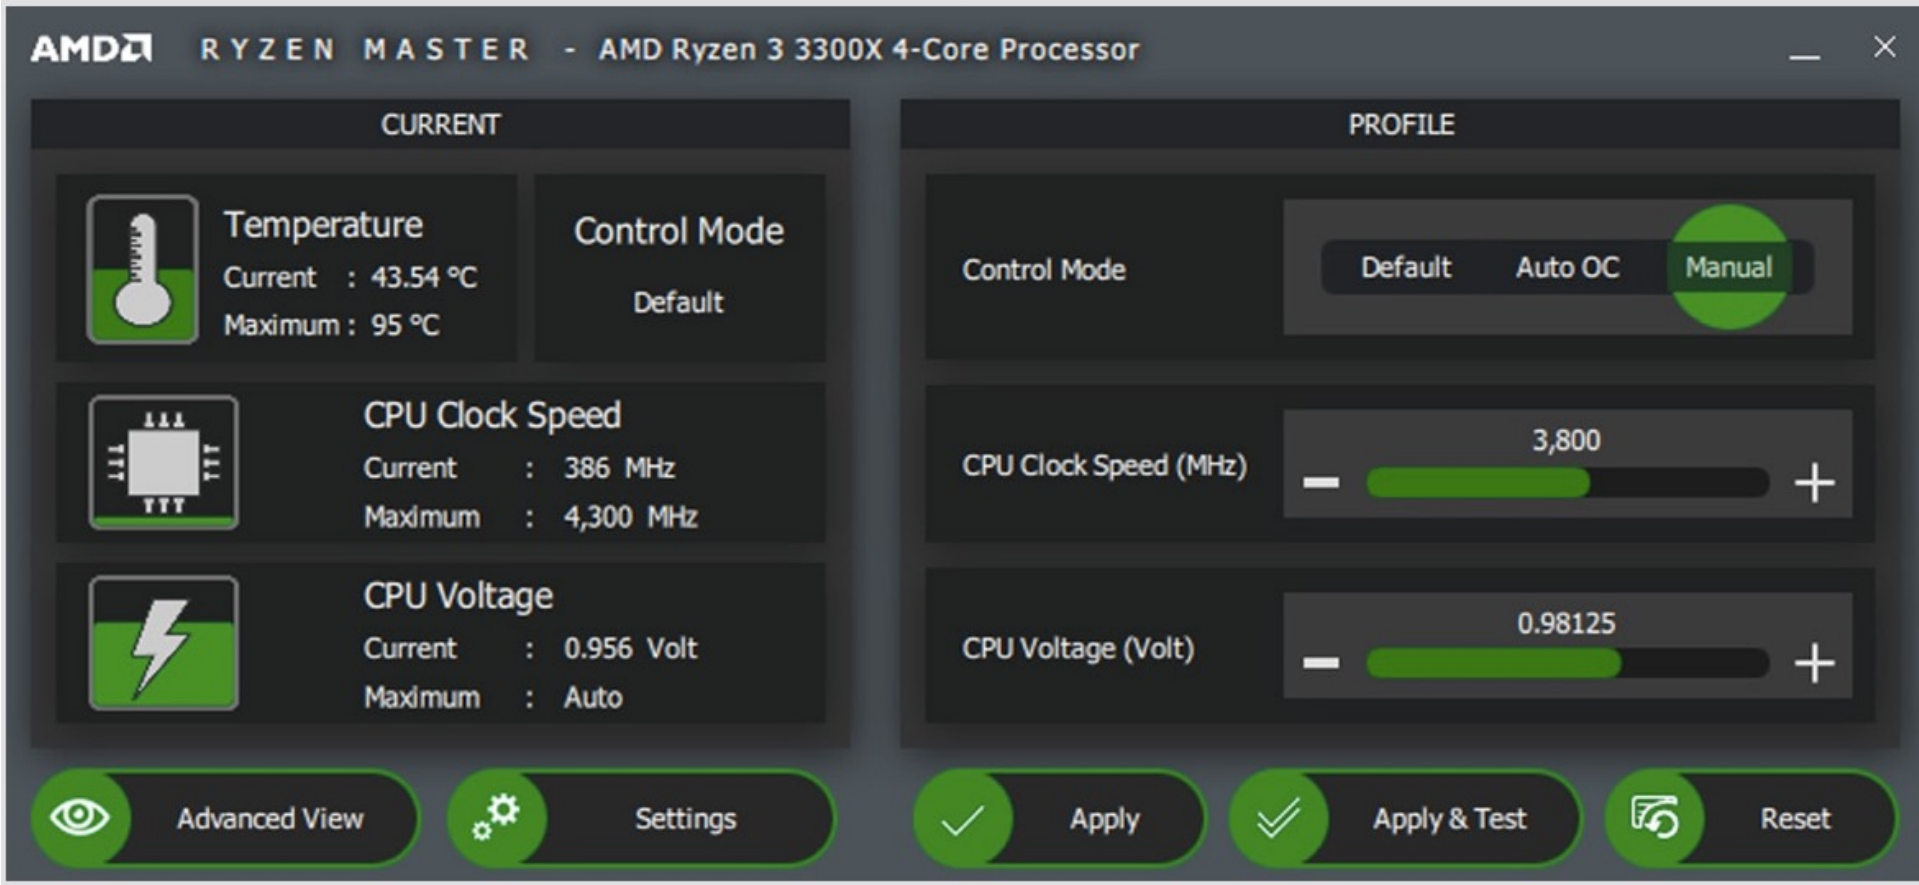
AMD Ryzen Master Utility for Overclocking Control



Every AMD Ryzen processor is multiplier-unlocked from the factory, so you can personalize performance to your taste. AMD provides the AMD Ryzen Master utility to access this powerful advantage.[1,2] As AMD Ryzen Master has evolved to support an increasingly diverse set of CPU products and features, the user interface has also grown increasingly complex. We have developed a useful "basic view" that provides access to the most essential features and telemetry. You can toggle between the new "basic view" and "advanced view" to see the overclocking features that are right for you.

Software Tools – Ryzen Master



AMD Ryzen Master (Basic View)

The new basic view provides you with the ability to automatically overclock your CPU, manually control how much overclocking you wish to apply as well and give you a view of important system parameters like the CPU temperature, speed and voltages.

AMD News Report WW47

- Announcements:
  - AMD and IBM announced a joint development agreement to advance confidential computing and artificial intelligence for the cloud. The announcement was covered by multiple outlets including Anandtech, Marketwatch, ZDnet and others.
  - AMD announced the new Ryzen Embedded V2000 processor. Coverage has appeared in outlets including CNX Software, HotHardware, Serve The Home, Tom's Hardware and others.
- Press continued to cover the launch of the Ryzen 5000 Series desktop processors and post review content, praising the new processors' overall performance, the architectural advancements of "Zen 3" and AMD's dominance in the CPU market. New coverage included Gamers Nexus, Hardware Canucks, MMORPG, SemiAccurate and others, with SemiAccruate concluding, "The 19% IPC uplift means that AMD wins at everything now."
- Tom's Hardware and others reported that the Ryzen 9 5950X set an overclock world record, hitting 6.362 MHz on all 16 cores.
- A number of press, including HEXUS, PCWorld, TechRadar and Tom's Hardware, discussed the availability of the Ryzen 5000 Series given how quickly many of the SKUs sold out. Most press argued that just because the CPUs had high demand does not mean this was a "paper launch."
- PCMag reviewed the ASUS TUF gaming A17 highlighting how the system is "a welcome change from low-cost gaming laptops with a skimpy 256GB of storage, and its Ryzen 7 processor is a real powerhouse."
- ServeTheHome reviewed the AMD EPYC 7H12 processor, naming it "the fastest CPU you can get in 2020" for raw computational power.

AMD News Report WW46

- Announcements:
  - Following the reviews embargo lift of the AMD Ryzen 5000 Series desktop processors, sentiment has been overwhelmingly positive, with press praising the lineup's performance, the improvements of the "Zen 3" architecture and AMD's dominance at the top of the CPU market in gaming and content creation. Coverage appeared in AnandTech, Forbes, HEXUS, Linus Tech Tips, PCWorld, TechRadar, TweakTown and more.
    - PCWorld: "many will see today as an historic shift in computing power…AMD has finally knocked Intel to the floor, and is raising its boxing gloves in victory as the flash bulbs pop and the ref declares a winner."
    - ExtremeTech: "'Zen 3' is an unparalleled success for AMD," as the new architecture "has literally redefined what kind of performance is possible within a given desktop power envelope."
    - JayzTwoCents: "the 5900X is quite honestly the best CPU you could possibly buy right now…for gaming, content creation, productivity, value – it's all there!"
  - Lawrence Livermore National Labs announced the new AMD EPYC-based "Mammoth" supercomputer system for memory intensive research workloads, including COVID-19 simulations and analysis. News appeared on The Next Platform, HPC Wire and Silicon Angle.
  - The reviews embargo lifted on Xbox Series X and S consoles, harnessing the power of "Zen 2" CPU cores and RDNA-based graphics to usher in the next generation of high-performance console gaming. AMD coverage sentiment has been positive, with press positioning the all-AMD hardware consoles as leaders in both raw performance and stunning, high fidelity visuals. Coverage appeared in IGN, WIRED UK, PCMag and more.
  - Reviews of the PlayStation 5 began to appear, with positive sentiment around AMD hardware and press praising the faster load times, better frame rates and gorgeous visuals enabled by the all-AMD console platform. Coverage appeared in The Verge, PCGamer, CNN and more.

AMD News Report WW44

AMD news:

- Fortune published its annual Most Powerful Women in Business list, featuring Lisa Su. Aaron Pressman covered how the most powerful women in tech have handled the pandemic, highlighting Lisa for her promotion of greater diversity and representation in her sector, as AMD "rocketed ahead this year as Intel stumbled."
- Lenovo announced the Ryzen-powered Lenovo Legion Slim 7, which will be available starting this month.
- Ian Cutress posted an interview with Mark Papermaster diving deeper into "Zen 3" and the Ryzen 5000 Series processors on AnandTech and his YouTube channel, TechTechPotato.
- CNET posted a positive review of the AMD-powered Dell G5 15 SE, highlighting how the system "delivers relatively high performance for the money."
- UltrabookReview reviewed the Ryzen-powered Lenovo ThinkPad T14s, concluding, "AMD's Ryzen Pro hardware is highly competent in all sorts of loads and highly efficient at the same time, allowing for excellent performance even in this slim ThinkPad T14s chassis."
- AMD EPYC CPUs and Instinct GPUs were included in a number of newly announced HPC systems from HPE customers. These include the 550 petaflop CSC Lumi system, the 50 petaflop Pawsey system, the all EPYC Los Alamos National Laboratory Chicoma system and the IT4 system in the Czech Republic. Coverage of the systems appeared in multiple outlets including HPCwire, The Next Platform, VentureBeat and others.
- insideHPC reported on this year's Exascale Day, sharing an interview with Brad McCredie of AMD and other HPC industry executives. Brad highlighted the AMD EPYC and Instinct processors that will power the upcoming Frontier and El Capitan supercomputers.
- Nextgov discussed the efforts made by AMD, HPE, the Energy Department's Exascale Computing Project or ECP, Lawrence Livermore, Argonne and Oak Ridge National Labs to share information about the potential capabilities of exascale systems.

Nvidia News

- Nvidia news:
  - Bloomberg News discussed Nvidia's acquisition of Arm and the many questions around the deal.
  - Huawei and other Chinese firms are reportedly raising concerns with regulators over Nvidia's acquisition of Arm as they fear Nvidia could force Arm to stop working with them. The companies are asking for the deal to be rejected, or for regulators to insist on specific conditions.
  - VideoCardz reported that Nvidia is allegedly preparing a new GeForce RTX 30 "GA102-150" Series GPU to take on the Radeon RX 6800 Series. The SKU would supposedly feature 7,424 CUDA cores, a 320-bit memory bus and 10GB of GDDR6 memory.
  - VideoCardz reported that Nvidia allegedly told board partners it will not launch the RTX 3080 20GB and RTX 3070 16GB graphics cards as planned. Originally slated for a December launch, this information from two independent sources noted the SKUs were cancelled, not postponed.
  - RedGamingTech claimed several sources have shared timelines for upcoming Nvidia RTX 30 Series SKUs: the RTX 3060 Ti launch is allegedly confirmed for November 17; the RTX 3060, a 6GB midrange card, should launch around January 7; and 4GB and 6GB RTX 3050 variants will launch in mid-Q1 2021 for the entry-level market.
  - Nvidia updated its NVDEC (video decoding) and NVENC (encoding) matrixes for the RTX 30 Series, confirming that Nvidia GA102 and GA104 GPUs will decide the new AV1 open format up to 10-bit and 8Kx8K resolution. The cards will not support AV1 encoding and only the HEVC video format is supported.
  - VideoCardz tweeted that RTX 3070 Founders Edition reviews will go live on October 27, and AIB reviews will post on October 29.
  - Nvidia announced new AI-powered Neural Filters in Adobe Photoshop, including the new Smart Portrait Filter, allowing creatives to make complex adjustments to photos leveraging Nvidia RTX GPUs.

AMD Buying Xilinx?

News Article

AMD News in Our AMD
More On AMD - Xilinx

Article by our own Kevin Krewell

> Once again, the chip company acquisition rumors are back! In this acquisition rumor AMD is in negotiations to buy Xilinx. And, again, this story comes from the Wall Street Journal, just as the rumor of NVIDIA buying Arm was, the veracity of which was later substantiated. The reason why these speculative reports come from the Wall Street Journal is that it is well connected with the investment banking community, which gets involved in these types of large acquisition deals. That said, AMD acquiring Xilinx is something that really seems to have come out of left field to us.

AMD Buying Xilinx?

> Advanced Micro Devices Inc. is in advanced talks to buy rival chip maker Xilinx Inc., according to people familiar with the matter, in a deal that could be valued at more than $30 billion and mark the latest big tie-up in the rapidly consolidating semiconductor industry.

AMD Buying Xilinx?

- AMD buys Xilinx for $30B!

Xilinx

Xilinx

From Wikipedia, the free encyclopedia

Xilinx, Inc. (/ˈzaɪlɪŋks/ *ZY-links*) is an American technology company that develops highly flexible and adaptive processing platforms. The company invented the field-programmable gate array (FPGA), programmable system-on-chips (SoCs), and the adaptive compute acceleration platform (ACAP). It is the semiconductor company that created the first fabless manufacturing model.[4][5] Xilinx's products are used across many industries and technologies, including the data center, wired & wireless communications, AI/ML, automotive, industrial, consumer, aerospace and defense and Broadcast & Pro-AV.

Co-founded by Ross Freeman, Bernard Vonderschmitt, and James V Barnett II in 1984, the company went public on the NASDAQ in 1989.

AMD announced its acquisition of Xilinx in October 2020.[6]

AMD News Report WW41

- Announcements:
  - AMD announced VMware vSphere now supports the advanced SEV-ES security feature. AMD also highlighted the growth of the EPYC-based VMware ecosystem. Coverage appeared in CRN, SDXcentral, Storage Review, ZDNet and others.
  - AMD announced the Okinawa Institute of Science and Technology Graduate University is using AMD EPYC 7702 processors to power a 2.36 petaflop system used for research at the university.
  - AMD announced the new Radeon Software Adrenalin 2020 Edition 20.9.2 will deliver Day-0 support for STAR WARS: Squadron, bringing impressive performance and high-framerate gameplay from 1080p to 4K resolutions with Radeon RX 5000 Series graphics.
  - AMD announced the AMD Radeon Graphics 'Raise the Game' offer has been extended through December 5, 2020, giving Radeon gamers more time to score some of 2020's hottest titles with the purchase of select AMD Radeon graphics products, including Godfall (Radeon RX 5500 series) or both Godfall and World of Warcraft: Shadowlands (Radeon RX 5600 and 5700 cards).
